

IndiGo MarTech RFP Review – Consolidated Report

Date: 7 July 2026

Scope: Enterprise Digital Analytics Platform RFP · Personalization & Experimentation Platform RFP · Marketing Automation (Campaign) Platform RFP

Baseline data: Analytics server-call volumes (Jul-25 to Jun-26), Analytics workspace usage & access log (Apr–Jun 26), Adobe Target activity exports (last quarter + trailing 12 months page views), Daily campaign summary report (3-Jul-26)

1. Utilization Data Baseline

All findings below are anchored to the following numbers.

1.1 Digital Analytics (current platform: Adobe Analytics)

Metric	Value
Annual server calls (Jul-25 → Jun-26)	5.97 billion
Peak month	721.0M (Oct-25) ; Sep-25 697.5M
Average month	~497M
Peak-to-average ratio	~1.45x (monthly); intraday sale-day peaks materially higher
Volume by report suite (12-mo)	B2C Web & Mobile 5.32B (~89%) ; B2B Web 240M; Dev/WebSDK ~400M
Mobile share of B2C primary calls	~1.9B mobile primary of 5.32B (~35%)
Active analytics users (last 3 months)	71 named users (incl. 3–4 Adobe partner accounts)
Workspace project events (Apr–Jun 26)	15,400 events / quarter across those 71 users

Derived design points: annual average ≈ **190 events/sec**; peak-month average ≈ **270 events/sec**; applying a conservative 10x intraday burst factor for sale events (BOGO-type promotions, IROPs surges), the ingestion tier should be specified at **≥3,000 events/sec sustained, ≥5,000 events/sec burst** – to be validated with hourly-grain data if available.

1.2 Personalization & Experimentation (current platform: Adobe Target)

Metric	Value
Live activities (quarter-end snapshot)	984 concurrently live
New activities per month (last quarter)	153 / 67 / 55 (avg ~92/month)
Activities with recorded page views (trailing 12 mo)	1,609 activities; 79.5B cumulative activity page views

Metric	Value
Largest single activity	1.25B page views
Activity mix	A/B (manual) 508 · Experience Targeting 468 · Auto-Allocate 6 · Auto-Target 2
Decisioning method	100% server-side (984 of 984)
Activities with a defined Goal	3 of 984
Activities with Est. Lift in Revenue recorded	0 of 984

Two strategic signals here. First, IndiGo is already operating at a scale ($\approx 1,000$ concurrent server-side activities, $\sim 1,600$ activities/year) that many personalization vendors have never supported in production – this must be a hard, disqualifying requirement, not an open question. Second, AI-driven decisioning adoption is $<1\%$ and experiment measurement discipline is effectively absent (no goals, no revenue-lift capture). The RFP should procure not just the capability but enforced measurement governance and an AI-decisioning adoption pathway.

1.3 Campaign / Marketing Automation (current platform: Adobe Campaign v7)

From the 3-Jul-26 daily summary report:

Metric	Value
Total addressable profiles	85.08M (Active 90-day: 18.90M · Inactive: 66.17M → 78% inactive)
Daily sends – Email	21.28M ($\approx 7.8\text{B}/\text{yr}$ annualized)
Daily sends – App Push	10.78M ($\approx 3.9\text{B}/\text{yr}$ annualized)
Daily sends – WhatsApp / RCS / Webpush	77.7K / 12.3K / 4.5K
Transactional itinerary emails	212.7K/day
Email performance	Open 17.69% · Click 0.2% · Unsub 0.02%
App Push performance	Open rate 0.01% (933 opens on 10.78M sends – near-certain instrumentation/delivery defect)
Abandon-cart	Email 102.7K/day (open 15.47%) · WhatsApp 64.9K/day (open 48.69%)

Derived design points: total cross-channel volume already runs at **$\sim 12\text{B}$ messages/year**; a 21M-email daily batch delivered in a 4–6 hour window implies **$\geq 5\text{M}$ messages/hour sustained throughput** before any headroom for sale-day or disruption-day bursts. The 78% inactive base and 0.2% email CTR mean reactivation and channel-mix rebalancing (WhatsApp opens at 48–56% vs email at 15–19%) are the highest-value commercial levers – the RFP currently treats win-back as a single template mention.

2. Findings – Analytics RFP

2.1 Scaling & Volumetrics

The RFP's Performance & Scalability section (IV.3) is written entirely in unquantified language: "billions of analytics events annually" (3.2.4), "millions of customer profiles" (3.2.5), "thousands of concurrent business users" (3.2.6), "near real-time" (3.1.1), "low-latency" (3.1.3). Every vendor in the market can claim compliance with these as written. Against the baseline: IndiGo needs **6B events/year today**, growing to an estimated **12–15B/year by Year 5** (assumptions in §6), with peak-month 721M and sale-day bursts. These numbers should be mandated, with a contractual load-test acceptance criterion.

"Thousands of concurrent business users" is the opposite problem – an **over-specification**. The access log shows 71 active users generating 15.4K workspace events per quarter. Realistic Year-5 sizing is ~150–200 named users, ~30–50 peak concurrent. Over-specifying here inflates seat-based licensing quotes and lets weaker vendors compete on an irrelevant dimension; right-sizing it directly serves the LCC cost discipline.

The "Provide:" blocks throughout (e.g., "Maximum events processed per second", "Maximum daily event volume") ask vendors to volunteer their own ceiling figures. This inverts the burden of proof – vendors will quote theoretical global-platform maxima. Each should be converted to a compliance statement against IndiGo's stated numbers ("Confirm ability to ingest ≥5,000 events/sec burst with p95 ingestion-to-availability latency ≤ X minutes, evidenced by a named production reference at comparable scale").

No requirement addresses **bot and scraper traffic segregation**. For an airline of IndiGo's market position, OTA/meta-search fare scraping is a material share of search-page traffic; without a mandated bot-filtering and non-billable-traffic requirement, IndiGo will pay event-based licensing on scraper hits. This is one of the largest hidden commercial exposures in the document.

No **look-to-book context** is given. Airline search volumes vastly exceed bookings; vendors sizing storage/compute from "bookings" language will under-quote and re-price later. State the search-to-booking event ratio explicitly in the baseline annexure.

2.2 Ambiguities

Section IV.7 (Data Management & Retention) requires "configurable retention" but never states IndiGo's required retention (recommend: 25 months interactive/hot + 5 years queryable archive, aligned to fiscal-year cohort analysis). "Ability to support historical analytics" (7.1.5) is unanswerable as written. Latency, availability (no uptime % is stated anywhere in the Analytics RFP, unlike Campaign's 99.9%), RPO/RTO, and report-query response times all lack numbers. The compliance matrix (C/PC/NC) is defined, but nothing prevents a vendor marking "C" against an aspiration – each requirement carrying commercial weight needs an evidence standard.

Migration is a critical omission: current-state Adobe Analytics migration (historical data, report suites, calculated metrics, segments, classification data) appears only obliquely in Vendor References 9.1.1 ("experience in migration from Adobe analytics stack") – there is no scoped migration requirement equivalent to the Campaign RFP's §71–74. If a non-incumbent wins, IndiGo loses up to 5+ years of clickstream history unless this is contracted.

2.3 Duplications (cross-RFP)

Sections III.3 (Identity Resolution & Unified Profiles) and III.8 (Audience Management & Segmentation) substantially restate CDP functionality that also appears in the Campaign RFP (functional items 1–10) and the Personalization RFP (Customer Segmentation + progressive-profile requirements). As drafted, IndiGo is procuring identity resolution and segmentation **three times**. Beyond duplicated licensing, three vendors will each claim to be the "system of record" for identity – a governance failure mode. Recommend a cross-RFP architecture statement: the CDP (or the Analytics platform's profile service – to be decided) is the single system of record for identity and audiences; Personalization and Campaign platforms are mandated consumers via real-time APIs/streams.

Also duplicated: AI/predictive requirements (Analytics III.9 vs Personalization AI-Powered Decisioning vs Campaign items 40–45), dashboards/reporting (Analytics III.12–13 vs both others' analytics sections), and vendor-reference sections – Analytics 9.1.4–9.1.6 are lifted verbatim from the Personalization RFP (including "experimentation and personalization programs", which is out of scope for an analytics platform).

2.4 Missing aviation / IndiGo specifics

Journey analytics (III.4.1.10, 4.2.7) commendably references IROPs correlation – retain. Missing: PNR/booking-record data-model support (PNR, segment, coupon, SSR, fare-family structures as first-class dimensions); look-to-book and route-level funnel benchmarks; ancillary revenue-per-passenger as a standard metric; 6E Rewards/BluChip tier as a mandated profile dimension; turnaround-time and disruption-day traffic-pattern handling (traffic to flight-status pages spikes 10–20x on fog/IROP days and this shifts the event mix, not just the volume); GST-invoice and B2B/agent-portal (SME/corporate) analytics – B2B is already 240M calls/year in the data and is barely mentioned; app-store review/vitals correlation for the mobile app.

3. Findings – Personalization & Experimentation RFP

3.1 Scaling & Volumetrics

The RFP asks vendors to "Provide: Peak requests per second supported... Annual experimentation volume supported" – again inverting the burden. The Target data gives IndiGo unusually strong negotiating numbers that are absent from the document: **~1,000 concurrently live activities, ~1,600 activities/year, 79.5B activity page views/year, 100% server-side decisioning**. Very few platforms have production references at this concurrency. These must appear as mandatory minimums: support $\geq 1,200$ concurrent activities (Year-1) scaling to $\geq 2,500$ (Year-5); server-side decision latency ≤ 50 ms p95 at $\geq 2,000$ decisions/sec burst; annual decision volume sized from the 6B-event baseline.

The 100% server-side profile is strategically important: many challenger experimentation vendors are client-side-first. A vendor that is weak server-side fails IndiGo's actual operating model regardless of feature checkbox scores – this should be a gating criterion, and the client-side requirements (visual editor, anti-flicker) should be secondary.

3.2 Ambiguities and vendor-specific phrasing

Several requirements are written in **Adobe Target's proprietary vocabulary**: "Auto-Allocate", "Auto-Target", "Automated Personalization", the XT/A-B activity framing, and the explicit integration list "Experience Platform, Analytics, Audience Manager, Campaign, Marketo Engage." Two problems. First, non-Adobe OEMs will respond NC/PC to the *naming* rather than the *capability*, corrupting the compliance matrix; each should be rewritten capability-neutrally ("multi-armed-bandit traffic allocation", "per-visitor ML experience selection", "multi-slot combinatorial offer optimization") – the substance of these requirements is actually excellent and should be preserved. Second, Audience Manager is a sunset product line; naming it as an integration target dates the document – replace with "CDP / audience system of record."

Performance language is vague where it matters most for conversion: "fast load times", "low-latency rendering". Recommend explicit budgets: client-side flicker $\leq X$ ms / zero layout shift attributable to the tool (CLS budget), SDK size ceiling for the app, decision-API p95/p99 latencies, and a fail-open guarantee (booking funnel proceeds untouched if the decisioning service degrades – the RFP's "failsafe mechanisms" bullet gestures at this but sets no standard).

The measurement-governance gap in the data (3/984 activities with goals, 0 with revenue-lift estimates) should translate into a requirement the RFP currently lacks: the platform must **enforce** hypothesis, primary metric, guardrails and revenue attribution as mandatory activity metadata, with portfolio-level program reporting. Otherwise IndiGo buys a better engine and reproduces the same measurement debt.

3.3 Duplications

Journey Orchestration & Real-Time Customer Engagement (including cross-channel triggers via Email/Push/SMS/WhatsApp) and Abandon Cart Recovery duplicate the Campaign RFP almost use-case-for-use-case. Recommend boundary language: the Personalization platform owns **onsite/in-app** session interventions and exit-intent; the Campaign platform owns **outbound cross-channel** recovery journeys; both consume shared audiences and a shared abandonment event stream. Segmentation and predictive-audience requirements duplicate Analytics III.8 and Campaign items 1–10 (see §2.3). Measurement/executive-dashboard requirements duplicate Analytics III.12.

3.4 Missing aviation / IndiGo specifics

Strong aviation content already present (fare-family next-best-offer Saver→Flexi→Stretch, cabin config, gate-change nudges, BluChip) – retain and commend. Missing: IROPs mode (suppress upsell nudges and switch to service messaging during disruptions – personalizing a lounge upsell to a passenger whose flight was just cancelled is a brand-risk scenario the RFP never addresses); DPDP Act 2023 consent propagation into decisioning (consent appears in the NFRs but not as a decisioning-time check); dynamic-pricing-presentation guardrails (the RFP asks for fare/inventory signals in AI decisioning – this needs an explicit fairness/compliance constraint so "personalized pricing" doesn't create regulatory exposure); group/family PNR context; B2B/agent-portal exclusion or inclusion rules.

3.5 Document hygiene

The IndiGo introduction invites suppliers for an "App engagement & Personalization Platform" while the cover says "Personalization & Experimentation Platform" – inconsistent product naming within the same document. Section-numbering is broken in the NFRs (orphaned "9.1–9.8" list under "System Integration"); "Experimence Management" typo; "poornetwork", "Lowlatency" spacing defects; residual "Top of Form / Bottom of Form" artifacts from form-field copy-paste; TOC page numbers do not match actual content. Milestones table is populated (due 31-Jul-26) – consistent.

4. Findings – Campaign / Marketing Automation RFP

4.1 Scaling & Volumetrics

The NFR table's scalability rows (items 1–3) say only "high-volume", "large-scale", "minimal latency". Against the baseline, the RFP should mandate: **85M+ profiles at go-live scaling to ~150M by Year 5**; sustained send throughput **≥5M messages/hour** with burst capability for sale days (recommend 3x = 15M/hour, to be validated); transactional latency SLA (itinerary/booking confirmations, 212K+/day, delivered ≤60 seconds from trigger event); journey-trigger event ingestion sized to the abandonment stream (~170K abandon-cart messages/day today implies a much larger upstream event volume); and concurrency (number of simultaneous journeys/campaigns in flight – current Adobe Campaign workflow counts should be disclosed).

The **IROPs burst case is entirely absent** and is aviation's defining messaging scenario: a North-India fog day can require rebooking/disruption notifications to hundreds of thousands of passengers across SMS/WhatsApp/Push/Email within an hour, with regulatory (DGCA passenger-communication) implications. This is simultaneously the highest-volume, highest-latency-sensitivity, and highest-brand-risk use case – it should be a mandatory scenario with a live demonstration requirement and its own throughput SLA.

The daily report also exposes two data-quality issues the RFP should force vendors to solve rather than inherit: App Push open rate of 0.01% (933 opens on 10.8M sends – broken open-tracking or delivery measurement) and email CTR of 0.2%. Require an instrumentation and deliverability audit as an implementation deliverable, with baseline-vs-target KPI commitments.

4.2 Ambiguities

Functional item 71–74 (Adobe Campaign v7/v8 migration) is well-scoped in kind but not in quantity – no counts of workflows, templates, typology rules, suppression lists, or years of delivery-log history to migrate. Vendors will price migration with broad caveats; attach a migration inventory annexure. "Wherever feasible" (item 72) is an escape hatch – replace with a defined minimum (e.g., 24 months of delivery/response logs mandatory).

Item 4 (99.9% monthly availability) is the only quantified NFR in all three documents – good, but 99.9% permits ~43 minutes' downtime monthly; for a platform carrying transactional itinerary mail, recommend 99.95% for transactional messaging paths, with RTO/RPO numbers (item 5 currently asks the vendor to "define" them – IndiGo should set them).

4.3 Duplications

Items 36–42 (Personalisation & Decisioning: NBO, propensity, churn, A/B/multivariate) duplicate the Personalization RFP's core scope; items 1–10 duplicate CDP/identity scope (see §2.3); items 46–53 (analytics, attribution, journey analytics, dashboards) duplicate Analytics III.7 and III.12. The abandoned-cart journey (item 27 + scope bullet) duplicates the Personalization RFP's Abandon Cart section. Recommend the boundary statement in §3.3 plus: attribution methodology is owned by the Analytics platform; Campaign reports channel-level delivery/engagement and consumes conversion attribution rather than re-deriving it (today's daily report already shows metric-definition drift, e.g., a 3875.26% delta artifact in the promotional email row).

4.4 Missing aviation / IndiGo specifics

Item 10 (PNR, fare family, SSR, ancillary history, loyalty tier attributes) is excellent – retain. Missing: **TRAI/DLT compliance for SMS in India** (template and header registration, DND scrubbing – mandatory for any India SMS sender and absent from the consent section); WhatsApp Business Platform category management (utility vs marketing message pricing and Meta quality-rating protection at 78K/day scale); multilingual content (Indic languages) for an increasingly Tier-2/3 customer base; disruption/IROP communication workflows (§4.1); loyalty statement/expiry lifecycle messaging for BluChip; marketplace partners (Hotels/Cabs/Sightseeing campaigns already run today per the report – the RFP's "Marketplace & Ancillary Revenue CRM Enablement" scope bullet has no corresponding functional requirements rows).

The **78% inactive base** finding warrants a dedicated scored use case: reactivation program design across cheap-reach channels (RCS/WhatsApp show 48–56% open rates at trivial current volumes), with incrementality measurement – arguably the single largest revenue opportunity in the entire programme and currently one clause ("win-back" in item 27).

4.5 Document hygiene (several are disqualifying-grade defects)

The IndiGo introduction invites proposals for an "**App engagement & Personalization Platform**" – the wrong platform; this is a copy-paste from the Personalization RFP and would embarrass the procurement if released. The Terms section instructs packages to be marked "**RFP For Billing Information Data Tapes (BIDT)**" with a deadline of "**30th Aug 23**" – residue from an unrelated 2023 RFP. The Limitation of Liability clause reads "an amount to equivalent **hundred percent (200%)**" – words and figures contradict (note: per your instruction I will not alter legal terms; this is flagged for IndiGo Legal to resolve, since the contradiction is a material drafting defect either way). The milestones table is internally implausible (Acknowledgement 1/7/2026, technical submission 9/7/2026 – an 8-day response window for an enterprise platform RFP, inconsistent with the Analytics RFP's ~3-week window) and the proposal-due date on the cover is blank ("__xx__"). The contact-details name cell is blank ("_____") while emails are populated.

5. Growth Assumptions Requiring IndiGo Confirmation

The 5-year volumetric targets used above assume: digital traffic growing broadly with capacity and international expansion plus direct-channel share gain – modelled at **~15–20% CAGR**, i.e., ~2.0–2.5x current volumes by Year 5 (events: 12–15B/yr; profiles: ~150M; messages: ~25–30B/yr). These are placeholders derived from the current run-rate, not from IndiGo's network plan. The multiplier should be confirmed against IndiGo's fleet/ASK plan and direct-channel share targets, since it drives every capacity clause and every commercial overage table.

5-Year Industry & Product Roadmap Alignment

The purpose of this is to ensure the three RFPs do not procure 2026-era platforms for a 2027–2031 operating horizon. Each theme below states where the RFPs stand today and the specific roadmap requirements to insert (the corresponding text edits appear in the tables, keyed R2-x).

Growth model (to be ratified): ~15–20% CAGR → Year-5 design points of 12–15B events/yr, ~150M profiles, 25–30B messages/yr, ≥2,500 concurrent personalization activities.

2.1 AI & Hyper-Personalization

Current RFP posture. All three documents ask for AI in checklist form ("AI/GenAI-assisted content generation", "predictive analytics, anomaly detection, churn prediction", "Auto-Target/Automated Personalization"). None distinguishes shipped capability from roadmap vapour, none sets adoption or governance expectations, and none anticipates agentic AI. The utilization data shows why this matters: despite owning AI decisioning today, IndiGo's adoption is under 1% (6 Auto-Allocate + 2 Auto-Target activities out of 984). Buying more AI features without enablement and enforced measurement will reproduce the same shelf-ware outcome on a new platform.

Roadmap requirements to insert (R2-1 series).

Generative and agentic capability should be specified as *evaluable use cases with maturity declarations* (GA today / GA ≤12 months / roadmap ≥12 months, contractually held): natural-language analytics ("ask the data" query, auto-generated insight narratives, anomaly root-cause explanation) for the Analytics platform; brand-governed generative content variants (subject lines, banners, Indic-language localization) with human-in-loop approval, prompt audit logs and PII isolation for Campaign; and per-visitor generative experience assembly plus AI agents that propose, launch and conclude experiments under governance rules for Personalization. Real-time dynamic *presentation* of pricing (framing, bundling, urgency treatments driven by fare/inventory signals) should be required with an explicit fairness/compliance guardrail clause – personalized price *levels* carry regulatory and brand risk and must remain a rules-governed, auditable domain. Predictive cohort building (propensity to book, ancillary attach, churn from direct channel, LTV) should require out-of-box airline-relevant models *and* bring-your-own-model support, with explainability output as a mandatory artefact. Finally, each RFP should require an **AI adoption plan** – named customer-success motion, quarterly adoption KPIs (e.g., ≥30% of activities using algorithmic allocation by Year 2) – so capability translates to usage.

2.2 Data Scale & Real-Time Architecture

Current RFP posture. Scaling language is unquantified ("billions of events", "high-volume", "minimal latency") and the documents are silent on the traffic *shape* that defines airline digital: look-to-book ratios (search events vastly outnumber bookings and grow faster than bookings as meta-search and fare-watch behaviour intensifies), sale-day bursts, and IROP-day traffic inversions (flight-status and rebooking journeys spiking 10–20x while booking traffic collapses).

Roadmap requirements to insert (R2-2 series).

Volumetrics per the baseline and Year-5 design points, mandated rather than solicited. Streaming-first architecture: event ingestion-to-profile-update latency ≤5 seconds p95 (so an abandonment on the app can be actioned on the web within the same session); decision-API latency ≤50ms p95 server-side at ≥2,000 decisions/sec burst; campaign trigger-to-send ≤60s for transactional. Warehouse-native / zero-copy access: the platform must expose full-fidelity event data in open formats (Parquet/Iceberg or equivalent) queryable in IndiGo's lakehouse without per-query export fees – this is the primary anti-lock-in and Year-5 cost-control mechanism, and directly serves the LCC unit-economics lens because it lets IndiGo shift heavy analytical workloads to commodity compute. Bot/scrapper segregation with non-billable treatment for filtered traffic. Cookieless durability: server-side collection, first-party identity graph, and no dependency on third-party cookies anywhere in the identity design.

2.3 OEM Evolution – Composable (MACH), CDP-Centric, API-First

Current RFP posture. The three RFPs, read together, implicitly procure three overlapping suites – identity, segmentation, journey orchestration, analytics and AI appear in all three – which is the monolithic-suite failure mode the market has spent five years moving away from. The Personalization RFP also hard-codes the incumbent product names (including a sunset audience product) as integration targets.

Roadmap requirements to insert (R2-3 series).

A single **architecture boundary statement** in all three RFPs: the CDP/audience layer is the system of record for identity, consent and segments; Analytics owns measurement and attribution; Personalization owns onsite/in-app decisioning; Campaign owns outbound orchestration; all four exchange data over documented real-time APIs and streams. MACH conformance should be scored, not assumed: every business capability exposed via public API (API parity with the UI), event-driven interfaces (webhooks/streams) for all state changes, headless delivery for personalization (the server-side model IndiGo already runs 100% of activities on), and independent scalability of components. Vendors must declare integration patterns per ecosystem role (real-time vs batch, native vs connector, licensing prerequisites) instead of per named product. Finally, exit provisions belong in the technology requirements, not just legal terms: full data export in open formats at no incremental cost, documented off-boarding runbook, and configuration portability statements – a five-year roadmap must price the *end* of the contract as well as the beginning.

2.4 Aviation-Specific 5-Year Themes

Three forward-looking items with no home in any current RFP: (i) **NDC/Order-centric retailing** – as the industry migrates from PNR to Orders, the data model of all three platforms must accommodate offer/order identifiers alongside PNR; a compatibility statement should be required now to avoid re-platforming mid-contract. (ii) **Conversational and assistant-mediated journeys** – the Analytics RFP lists chatbots as a channel, but none of the RFPs requires measurement or personalization of AI-assistant-mediated bookings (including third-party assistants arriving via APIs), which will be a material channel within the horizon. (iii) **Marketplace expansion** – Hotels/Cabs/Sightseeing already run in production (71K hotel emails/day; hotel personalization activities live in Target) and the Personalization RFP's extensibility bullet plus the Campaign RFP's marketplace scope bullet need corresponding functional requirements so vendors price multi-vertical catalogs, not a flights-only funnel.

Structured Evaluation Tables

Edit-marker convention (applied in the "Proposed Change" column): deletions shown as ~~struck-through text~~; insertions shown as **[INS] bold text**; whole-clause additions marked **[NEW CLAUSE]**; items flagged but deliberately not edited (legal/copyright/confidentiality per operating protocol) marked **[FLAG–LEGAL, NO EDIT]**. Original IndiGo formatting, copyright notices, confidentiality clauses and legal terms are untouched throughout. Quotes in "Original Text" are abridged to the operative words.

CAMPAIGN (Marketing Automation Platform RFP)

Section / Clause #	Original Text / Issue	Proposed Change / Recommendation	Justification (Why this helps IndiGo's 5-Year Strategy)
InterGlobe Aviation Limited (intro, p.4)	"...capabilities to provide solution to 'App engagement & Personalization Platform'..." – wrong platform name, copy-paste from Personalization RFP	"App engagement & Personalization Platform" [INS] "Enterprise Marketing Automation Platform"	Removes a credibility defect that invites vendor queries and cross-RFP confusion; clean scope naming is prerequisite to the boundary framework across the three procurements.

Section / Clause #	Original Text / Issue	Proposed Change / Recommendation	Justification (Why this helps IndiGo's 5-Year Strategy)
Cover page / Terms – submission instructions	Proposal due date blank ("____xx____"); packages to be marked " RFP For Billing Information Data Tapes (BIDT) " with deadline "30th Aug 23" – residue of an unrelated 2023 RFP	Populate due date; " RFP For Billing Information Data Tapes (BIDT) ... 30th Aug 23" [INS] "RFP for Enterprise Marketing Automation Platform" + correct 2026 deadline (administrative correction, not a legal-term change)	A defective submission instruction is grounds for vendor protest and timeline slippage; transparent, correct logistics protect the evaluation's integrity.
Terms – (A) Limitation of Liability	"...shall not exceed an amount to equivalent hundred percent (200%) of the fees..." – words and figures contradict	[FLAG–LEGAL, NO EDIT] Refer to IndiGo Legal: confirm intended cap (100% vs 200%) and correct words/figures mismatch before release	A contradictory liability cap is unenforceable ambiguity that vendors will exception; resolving pre-release avoids 3 rounds of legal redlines per bidder.
RFP Milestones table	Acknowledgement 1/7/2026 → Technical proposal 9/7/2026 (8-day response window); demo/commercial rows blank	[INS] Re-baseline to ≥3-week response window aligned to Analytics RFP cadence (Ack 09-Jul → Queries 16-Jul → Resolution 23-Jul → Technical 30-Jul-26); populate demo and commercial dates	An 8-day window for an enterprise platform response guarantees shallow, boilerplate bids and disadvantages serious challengers – directly undermining the rigorous multi-OEM evaluation objective.
NFR items 1–3 (Platform Architecture & Scalability)	"...capable of supporting high-volume marketing automation workloads... handle large-scale campaign execution, high communication volumes... with minimal latency."	Retain text and [INS] append quantified schedule: "Specifically: ≥85M customer profiles at go-live scaling to ≥150M by Year 5; sustained send throughput ≥5M messages/hour with sale-event burst ≥15M/hour; journey/event trigger ingestion ≥1,000 events/sec; transactional messages (itinerary, booking confirmation – currently 212K+/day) dispatched ≤60 seconds from trigger, p95. Vendor shall confirm compliance with production reference evidence and accept a pre-go-live load test as an acceptance criterion."	Converts unfalsifiable adjectives into pass/fail engineering commitments sized from the actual 21.3M-email/10.8M-push daily run-rate; protects the 5-year growth curve and prevents post-award re-pricing.
NFR items 4–5 (Availability & Reliability)	"...minimum monthly availability of 99.9%..."; "The vendor shall define Disaster Recovery capabilities, including RTO, RPO..."	[INS] "Transactional messaging path: ≥99.95% monthly availability." The vendor shall define [INS] "The solution shall meet RTO ≤4 hours and RPO ≤15 minutes for platform configuration and in-flight journeys."	Itinerary and disruption messages are operationally critical; 99.9% permits ~43 min/month of silence. IndiGo, not the bidder, must set recovery objectives – vendors "defining" their own SLA is an evasion channel.
Functional items 71–72 (Migration & Transition)	"...migration from the existing Adobe Campaign V7/V8 environment... relevant historical campaign / delivery / reporting data, wherever feasible."	wherever feasible [INS] "at minimum: all active audiences, suppression lists, typology/frequency rules, live workflows and templates, and ≥24 months of delivery/response logs." [NEW CLAUSE] Annexure – Migration Inventory: counts of workflows, templates, typologies, suppression lists and data volumes to be provided to bidders	"Wherever feasible" lets the winning bidder de-scope migration after award. A quantified inventory yields comparable fixed migration pricing and protects continuity of frequency-capping/suppression compliance from day one.

Section / Clause #	Original Text / Issue	Proposed Change / Recommendation	Justification (Why this helps IndiGo's 5-Year Strategy)
Functional item 27 (Journey Orchestration)	"...lifecycle journey templates such as onboarding, abandoned cart, post-booking, ancillary upsell, win-back and loyalty engagement."	[NEW CLAUSE] "Inactive-Base Reactivation Programme: the solution shall support incrementality-measured reactivation journeys targeting IndiGo's ~66M inactive (90-day) profiles across low-cost/high-engagement channels (WhatsApp, RCS, Push), including holdout-group design, fatigue management and cost-per-reactivated-customer reporting. This use case will be demonstrated live and scored."	78% of the 85M base is inactive while WhatsApp opens at 48–56% vs email's 17.7% – the single largest commercial lever in the data. Elevating it from one word ("win-back") to a scored, measured use case ties platform selection to revenue, the LCC way.
Consent, Preference & Compliance (items 64–70)	Consent/preference framework present; no India telecom-regulatory requirements	[NEW CLAUSES] (i) "TRAI/DLT compliance for SMS: registered headers and content templates, principal-entity workflows, DND scrubbing prior to dispatch, with template-rejection handling." (ii) "WhatsApp Business Platform management: utility-vs-marketing category classification, per-category cost reporting, and Meta quality-rating monitoring with automated send-throttling on rating degradation."	SMS in India is undeliverable without DLT compliance, and WhatsApp economics/deliverability at scale are governed by Meta's category and quality regime. Both are hard operating constraints for the 5-year channel-mix shift the data demands.
Scope bullet "Marketplace & Ancillary Revenue CRM Enablement"	Scope bullet exists but has no corresponding functional requirement rows (items 1–74 are flights-generic)	[NEW CLAUSES] Marketplace requirements: multi-vertical campaign catalogs (Hotels, Cabs, Sightseeing), vertical-level consent/preference and frequency governance, cross-sell journeys triggered by active PNR context, and vertical P&L attribution reporting	Hotels/Sightseeing campaigns already run daily (71K hotel emails/day in the 3-Jul report); without explicit requirements, vendors price a flights-only funnel and marketplace expansion becomes a chargeable change request mid-contract.
Functional items 36–42 (Personalisation & Decisioning)	NBO, propensity, churn, A/B/multivariate – duplicates Personalization RFP core scope	Retain items; [INS] preface: "For decisioning capabilities that overlap the Personalization Platform: the Campaign platform owns outbound cross-channel decisioning; onsite/in-app session decisioning is owned by the Personalization platform; both shall consume shared audiences and a common abandonment event stream from the CDP/audience system of record (see Architecture Boundary Statement, Annexure)." [NEW ANNEXURE] Architecture Boundary Statement (identical across all three RFPs)	Eliminates triple-procurement of identity/segmentation/decisioning, prevents three vendors each claiming system-of-record status, and enables the composable (MACH/CDP-centric) target architecture – the core theme R2-3.
Missing – no IROPs requirement anywhere	Aviation's defining messaging scenario (mass disruption communications) absent	[NEW CLAUSE] "IROP/Disruption Communications: the solution shall support event-triggered mass notification to all affected passengers of a flight/network disruption across SMS, WhatsApp, Push and Email within 15 minutes of trigger, with automatic suppression of concurrent promotional sends to affected customers,	A fog-day in Delhi is simultaneously the highest-volume, lowest-latency, highest-brand-risk messaging event IndiGo faces, with DGCA passenger-communication obligations; a platform that cannot burst-

Section / Clause #	Original Text / Issue	Proposed Change / Recommendation	Justification (Why this helps IndiGo's 5-Year Strategy)
		multilingual templates, and regulator-auditable delivery logs. Mandatory live demonstration; burst throughput evidence required."	and-suppress correctly fails the airline use case regardless of marketing features.
Analytics & Reporting items 46–53 + observed data defects	Reporting requirements present; daily report shows App Push open rate 0.01% (933 opens / 10.78M sends) and email CTR 0.2% – measurement/deliverability defects	[NEW CLAUSE] "Implementation deliverable: end-to-end measurement and deliverability audit (open/click instrumentation, push-delivery receipts, seed-based inbox placement), with corrected KPI baselines published before hypercare exit and channel-KPI uplift targets agreed for Year 1." [INS] to item 53: attribution figures shall be reconciled to the Analytics platform as system of record for conversion attribution	IndiGo cannot run a 5-year engagement strategy on broken telemetry; forcing the audit into the winning bidder's scope converts a known defect into a contracted fix, and single-sourcing attribution ends the metric drift visible in today's reports.

ANALYTICS (Enterprise Digital Analytics Platform RFP)

Section / Clause #	Original Text / Issue	Proposed Change / Recommendation	Justification (Why this helps IndiGo's 5-Year Strategy)
IV.3.2.4	"Ability to process billions of analytics events annually."	billions of analytics events annually [INS] "IndiGo's current volume of ≥6.0B events/year (peak month 721M, Oct-25; ~89% B2C web & mobile), with sustained ingestion ≥3,000 events/sec and burst ≥5,000 events/sec, scaling to 12–15B events/year by Year 5 without architectural change. Compliance to be evidenced by a comparable production reference and a contractual pre-go-live load test."	Anchors capacity to validated run-rate plus the ratified growth curve; makes the requirement falsifiable and shifts scaling risk to the OEM for the full contract term.
IV.3.2.6	"Ability to support thousands of concurrent business users."	thousands of concurrent business users [INS] "≥200 named users with ≥50 concurrent active sessions" (actuals: 71 active users, 15.4K workspace events last quarter)	Over-specification inflates seat-based license quotes and skews evaluation toward irrelevant strengths; right-sizing is direct LCC cost discipline with 3x growth headroom already built in.
III.1 "Provide" block (pattern repeats in III.2–III.14)	"Provide: Maximum events processed per second. Maximum daily event volume supported..." – vendor volunteers own ceilings	Recast each "Provide: Maximum..." as [INS] "Confirm compliance with IndiGo's stated volumetric baseline (Annexure – Current State & Volumetric Baseline), citing at least one production deployment at ≥75% of IndiGo scale"; [NEW ANNEXURE]	Vendors quoting theoretical global maxima are non-comparable and evasive; compliance-against-baseline produces an objective, scoreable grid and dovetails with the scoring matrix.
III.1.1.8–1.1.9 (Data Collection)	Validation and peak-period ingestion covered; no bot/scrapper traffic requirement	[NEW CLAUSE] "1.1.10 Ability to detect, segregate and exclude bot/scrapper and non-human traffic (including	Fare-scraping is a material share of airline search traffic; without this clause IndiGo

Section / Clause #	Original Text / Issue	Proposed Change / Recommendation	Justification (Why this helps IndiGo's 5-Year Strategy)
		OTA/meta-search fare scraping) via IAB lists and behavioural detection, with excluded traffic reportable separately and excluded from any consumption-based billing metric."	pays event-based licensing on bot hits every year for five years – one of the largest hidden commercial exposures in the programme.
IV.7.1.2 / 7.1.5 (Data Management & Retention)	"Ability to support configurable data retention policies... historical analytics." – IndiGo's required retention never stated	[INS] "IndiGo requires ≥25 months of interactive (hot) event data and ≥5 years of queryable archive, with restated cost implications for each tier declared in the commercial response."	Fiscal-year and cohort analyses require ≥2 years hot; unstated retention lets vendors quote thin defaults and monetize extensions later – a classic 5-year TCO leak.
IV.9 Vendor References – missing migration scope; 9.1.4 numbered twice	Migration from Adobe Analytics appears only as vendor "experience" (9.1.1); 9.1.4 duplicates Personalization-RFP text ("experimentation and personalization programs")	[NEW SECTION] "Migration & Transition: migrate report-suite configurations, segments, calculated metrics, classification data and ≥24 months of historical event data from the incumbent Adobe Analytics environment (2 primary production suites, ~6B events/yr), with parallel-run validation and variance reporting ≤2% on agreed KPIs before cutover." Renumber duplicated 9.1.4; experimentation and personalization programs [INS] analytics-platform references at comparable event scale	Without contracted migration, a non-incumbent win forfeits 5+ years of clickstream history and every YoY benchmark; parallel-run variance criteria are what make cutover auditable. Removing lifted cross-RFP text keeps vendor evidence relevant to the domain being bought.
III.3 + III.8 (Identity Resolution; Audience Management)	Full identity-resolution and audience-activation stack specified – duplicating CDP scope also present in Campaign (items 1–10) and Personalization RFPs	Retain requirements; [INS] preface both sections: "These capabilities shall interoperate with, and where designated defer to, the enterprise CDP/audience system of record per the Architecture Boundary Statement (Annexure). Vendors shall declare which capabilities are native vs consumed, and price accordingly."	Stops IndiGo buying identity resolution three times and forces honest decomposition of suite pricing – foundational to the composable Year-5 architecture (R2-3).
IV.3.1 (Performance) – and absence of any uptime figure	"near real-time... low-latency... minimal processing delay" – no numbers; no availability SLA anywhere in this RFP (unlike Campaign's 99.9%)	[INS] quantified NFR pack: "Event ingestion-to-availability ≤5 minutes p95 (streaming datasets ≤5 seconds); standard report queries ≤10 seconds p95; platform availability ≥99.9% monthly; RTO ≤4h / RPO ≤15min."	Numbers make the compliance matrix mean something; sub-5-second streaming availability is also the enabler for same-session activation across the other two platforms (R2-2).
III.9 (AI-Powered Analytics)	Checklist AI ("predictive analytics, anomaly detection, churn prediction... automated insights") with no maturity or adoption expectations	[INS] "For each AI capability, vendors shall declare maturity (GA today / GA ≤12 months / roadmap), which declarations shall be contractually binding. The platform shall provide natural-language analytics query with generated insight narratives and anomaly root-cause explanation. Vendor shall commit to an AI-adoption enablement plan with quarterly usage KPIs."	Converts AI marketing into evaluable, warranted scope; the Target data (AI decisioning <1% adopted) proves IndiGo's real risk is shelf-ware, so adoption machinery is bought alongside features (R2-1).

Section / Clause #	Original Text / Issue	Proposed Change / Recommendation	Justification (Why this helps IndiGo's 5-Year Strategy)
IV.7.1.15–7.1.16 (warehouse-native, no lock-in)	Good intent present ("warehouse-native analytics... data export without vendor lock-in") but unenforced	[INS] "Full-fidelity event-level data shall be available in open columnar formats (e.g., Parquet/Iceberg) in IndiGo's lakehouse, continuously or ≤24h latency, at no per-query or per-export fee; schema documentation and an off-boarding runbook are contract deliverables."	Zero-copy open data is the decisive Year-5 cost and exit lever: it lets IndiGo run heavy workloads on commodity compute and credibly re-tender in 2031 – the strongest structural negotiating position an LCC can hold (R2-2/R2-3).
III.6 (Booking Funnel Analytics) + Annexure gap	Funnel stages well specified; no PNR/Order data-model or look-to-book context anywhere	[NEW CLAUSES] (i) "Native support for airline data structures – PNR, segment, coupon, SSR, fare family, ancillary codes, 6E Rewards/BluChip tier – as first-class dimensions." (ii) "The solution shall be sized for airline look-to-book traffic shape (search events materially exceeding bookings; ratio stated in the Volumetric Baseline Annexure) and for IROP-day traffic inversion (flight-status/servicing journeys spiking 10–20x)." (iii) "Data-model compatibility statement for IATA Offer/Order (NDC/ONE Order) identifiers."	Embeds the aviation physics that generic platforms mis-size: search-heavy traffic drives cost, IROP days invert the event mix, and the industry's PNR→Order migration will land inside this contract's term (R2-4).
Cover/header; intro; Commercial section	Cover says "Request for Proposal" but running header says "Request for Information"; "142 destinations" broken bold; Commercial response table is empty (blank S.No./Header/Cost rows)	Fix header to Request for Information [INS] Request for Proposal ; repair "142" formatting; [INS] mandated commercial line items: licence fees by billing metric (per-event/per-user), implementation, migration, managed services, training, and unit overage rates per additional 1B events and per additional named user	RFI/RFP confusion has procedural consequences for vendors' legal teams; a mandated cost structure is what makes commercial bids comparable and exposes the per-event economics that dominate 5-year TCO at IndiGo's volumes.

PERSONALIZATION (Personalization & Experimentation Platform RFP)

Section / Clause #	Original Text / Issue	Proposed Change / Recommendation	Justification (Why this helps IndiGo's 5-Year Strategy)
AI-Powered Decisioning & Optimization; Experimentation Platform	Requirements phrased in incumbent-proprietary vocabulary: "Auto-Target / contextual AI-based experience selection", "Automated Personalization", "Auto-Allocate"; intro invites bids for "App engagement & Personalization Platform" vs cover's "Personalization & Experimentation Platform"	Rephrase capability-neutrally, preserving substance: Auto-Target [INS] "per-visitor ML experience selection using session and historical context, with explore/exploit logic and explainable attribute reporting" ; Automated Personalization [INS] "multi-slot combinatorial offer optimization selecting best per-visitor combinations without manual setup of each combination" ; retain "multi-armed bandit" (already neutral) alongside Auto-Allocate . Harmonize product name to the cover title	Non-incumbent OEMs will answer NC/PC to <i>names</i> rather than capabilities, corrupting the compliance matrix; neutral phrasing keeps these genuinely excellent requirements while making the evaluation defensibly vendor-agnostic – essential to a transparent multi-OEM process.

Section / Clause #	Original Text / Issue	Proposed Change / Recommendation	Justification (Why this helps IndiGo's 5-Year Strategy)
NFR – System Integration, ecosystem clause	"...integrate natively or via supported connectors with IndiGo's ecosystem, including Experience Platform, Analytics, Audience Manager, Campaign, Marketo Engage..."	named-product list [INS] "IndiGo's ecosystem roles: CDP/audience system of record, digital analytics platform, campaign orchestration platform, loyalty platform, booking/PSS systems – declaring, per role: integration pattern, real-time vs batch, supported use cases, and any licensing prerequisites." (Note to IndiGo: one named product in the current list is a sunseting audience product and should not anchor a 5-year integration requirement)	Role-based integration wording survives IndiGo's own stack decisions across the other two RFPs and the 5-year horizon; naming products (including one approaching end-of-life) dates the document and telegraphs the incumbent, weakening negotiating leverage.
Experimentation Platform "Provide" block; Performance & Scalability NFRs	"Provide: Maximum concurrent experiments supported... Peak requests per second supported... Annual experimentation volume supported." – solicited, not mandated; NFRs say only "high-volume... low-latency... large-scale"	[INS] mandated minimums: "≥1,200 concurrently live activities at go-live (current actual: ~1,000, 100% server-side), scaling to ≥2,500 by Year 5; ~1,600 new activities/year; annual decisioned page views ≥80B (trailing-12-month actual: 79.5B); server-side decision latency ≤50ms p95 at ≥2,000 decisions/sec burst. Vendors shall evidence one production reference at ≥75% of this concurrency."	IndiGo's Target estate is objectively one of the largest server-side programmes in market – few OEMs can genuinely support it. Mandating (not asking) turns IndiGo's scale into a qualifying filter and negotiating asset; the server-side profile also correctly gates out client-side-first challengers that would fail the operating model.
Objective bullet; NFR "Performance"	"High-performance, scalable experience with fast load times and no adverse impact..."; "Lowlatency rendering of inapp experiences."	[INS] explicit budgets: "Client-side: content flicker ≤100ms with zero tool-attributable cumulative layout shift on booking-funnel pages; async, non-render-blocking delivery; mobile SDK ≤X MB with declared cold-start impact. Fail-open guarantee: booking and payment flows shall proceed unmodified within ≤50ms if the decisioning service is degraded or unreachable." Correct "Lowlatency"/"inapp"/"poornetwork" typographical defects	Every millisecond on the booking funnel is conversion revenue for an LCC; an un-budgeted personalization layer can destroy more conversion than it creates, and fail-open converts a vendor outage from a revenue event into a personalization gap.
Measurement, Analytics & Business Impact	Measurement capabilities requested, but nothing <i>enforces</i> discipline – actuals: 3 of 984 live activities have a Goal recorded; 0 of 984 have Est. Lift in Revenue	[NEW CLAUSE] "The platform shall enforce, as mandatory pre-launch metadata for every activity: hypothesis, primary success metric, guardrail metrics, and revenue-attribution method; and shall provide portfolio-level programme reporting (win-rate, cumulative measured lift, decision velocity) for executive review."	The data proves the gap is governance, not tooling: IndiGo runs ~1,600 activities/year and can attribute revenue to almost none. Enforced metadata converts the experimentation programme into an auditable P&L contributor – the core justification for the 5-year investment.
Journey Orchestration & Real-Time Customer Engagement; Abandon Cart Recovery & Conversion	Cross-channel recovery "across Email, Push, SMS and WhatsApp" – duplicates Campaign RFP journey/abandon-cart scope nearly use-case-for-use-case	[INS] boundary preface: "The Personalization platform owns onsite/in-app session interventions, exit-intent and returning-visitor recovery within owned digital properties; outbound cross-channel recovery journeys are owned by the Campaign platform; both consume a	Without the boundary, two vendors are paid to message the same abandoner – duplicate cost, frequency-cap violations, and irreconcilable attribution. Clean seams

Section / Clause #	Original Text / Issue	Proposed Change / Recommendation	Justification (Why this helps IndiGo's 5-Year Strategy)
		shared abandonment event stream and shared audiences per the Architecture Boundary Statement (Annexure, identical across all three RFPs)."	are what make the composable target architecture governable for five years.
AI-Powered Decisioning – "leverage information like inventory, fare availability and other commercial signals"	Fare/inventory signals in AI decisioning requested with no compliance guardrail	<i>*[INS] "Personalization of price presentation" (framing, bundling, urgency, offer sequencing) is in scope; algorithmic determination of differential price levels per customer is out of scope unless separately approved under IndiGo's pricing-governance policy. All fare-related decisioning shall be auditable and explainable."**</i>	Dynamic presentation captures the upside of hyper-personalization theme while insulating IndiGo from the regulatory and brand-trust exposure of personalized pricing – a distinction the RFP must draw before an eager OEM draws it for IndiGo.
Personalization / Journey Orchestration use cases	Rich contextual use cases (gate change, lounge upsell on early airport arrival) – no IROP suppression mode	[NEW CLAUSE] "Disruption Mode: on flight-disruption events, the platform shall automatically suppress promotional/upsell experiences for affected customers and switch affected journeys to service-context content within ≤5 minutes of the operational event, reverting automatically on resolution. Mandatory demonstration."	Upselling a lounge to a passenger whose flight was just cancelled is a viral brand-risk moment; disruption-aware suppression is the aviation-specific requirement that separates travel-grade platforms from generic e-commerce tools.
NFR Security block (DPDP readiness listed) vs decisioning requirements	Consent appears only as certification/NFR posture; no requirement that consent gates <i>decisions</i>	[INS] "Consent state (per DPDP Act 2023 purposes) shall be evaluated at decision time: customers lacking the relevant consent purpose shall receive default experiences, with consent-state changes propagating to decisioning ≤5 minutes."	DPDP enforcement matures inside this contract's term; decision-time consent is the difference between compliance on paper and compliance in the request path – retrofitting it later is a re-architecture.
No-Code / Low-Code section	"Ability of the system to consume Figma/design files provided by IndiGo and adapt them into the app without engineering support." – technically unrealistic as an absolute; also "Experimence Management" typo, "Top of Form/Bottom of Form" artifacts, orphaned 9.1–9.8 numbering under System Integration	consume Figma/design files... without engineering support [INS] "import design assets and design tokens from IndiGo's design system (e.g., Figma exports) into the visual editor for business-user assembly of experiences, with vendor stating precisely which asset types are supported without engineering involvement." Correct typo to "Experience Management"; strip form-field artifacts; repair NFR numbering	As written, every vendor either marks NC (honest) or C (untestable claim) – both outcomes damage the matrix. The reworded clause preserves the intent (design-to-live-experience velocity) in an evaluable form; hygiene fixes protect document credibility.
Vendor References, Travel Expertise & Proven Scale	"Provide top 5 enterprise customers. Mention at least 1 airline client... feasibility of handling volume size."	[INS] "References shall include at least one deployment operating ≥750 concurrent server-side activities OR ≥50B annual decisioned page views, verifiable via reference call; 'feasibility' statements without a production reference will be scored as Partially Compliant at best."	Ties reference evidence to IndiGo's actual operating point rather than logo count; pre-declaring the scoring treatment of unevidenced claims is what makes the matrix objective and protest-proof.
Extensibility objective bullet ("future	Objective present; functional requirements are flight-funnel-centric	[INS] "Recommendation catalogs, audiences and experiences shall support multi-vertical items (Hotels,	The Target export shows hotel/cab personalization is production reality today

Section / Clause #	Original Text / Issue	Proposed Change / Recommendation	Justification (Why this helps IndiGo's 5-Year Strategy)
marketplace initiatives – Hotels, Cabs, Sightseeing")		Cabs, Sightseeing, partner offers) at parity with flight ancillaries, including cross-vertical recommendation (active-PNR-triggered hotel/cab offers) – already live in IndiGo's current programme and to be migrated without redesign."	(e.g., PNR-based hotel personalization activities); pricing and architecting multi-vertical now avoids a chargeable scope expansion the moment marketplace revenue scales – central to the ancillary-led LCC growth thesis.
