App

Why Contentsquare

Product Analytics: 0% Tagging, 100% visibility

Autocaptured, trustworthy product data that shows where/when you're losing customers — and what to fix first. All this without the need to spend hours doing the analysis

Democratise Data

Understand user journeys and funnels, where they drop off, and hidden paths they are taking. Easily dive deeper into data, without the need to rely on analysts

No Events Tagging Needed

100% of your events captured, **without the need for manual tagging**. Ensure you are capturing ALL customer interactions. Retroactive analysis on newly launched events. Unified web+app analytics

Multi-session/cross-device Analytics

Understand mobile vs web & multi session users to know what they do when they return

- ✓ Every user interaction (clicks, taps, scrolls, pageviews, events)
- ✓ Complete user journeys (across sessions, devices, platforms)
- ✓ Behavioral cohorts (segmentation by attributes, actions, experiences)
- ✓ Retention & churn (day 1-30+, custom cohorts)
- ✓ Revenue attribution (LTV, AOV, revenue by segment/channel)
- ✓ Acquisition performance (channel, campaign, UTM-level metrics)
- ✓ Session replays (web + mobile, with event stream)
- ✓ Heatmaps (click, scroll, hover—web only)
- ✓ Errors & crashes (JS errors, API errors, mobile crashes)
- ✓ Impact quantification (how errors/friction affect conversion/revenue)

Exhaustive Metrics

Monitor an exhaustive list of metrics that matter, report business health, dive deeper into data – all at your fingertips

Experience Analytics: Understand the 'why' behind user behaviour

Granular understanding of customer journey and user behaviour, made easily accessible to teams

Session Replay with Frustration Scores

Watch replays of user sessions where funnel drop-off occurs with JS/API errors marked inside the replays. Match events to user experience and behavior.

Zoning and Heatmaps

Understand user behavior via custom heatmaps and element level zoning analysis to deeply understand user behaviour and use that to optimise UI/UX across web and mobile

Journeys & Funnels

Visualise customer journeys and funnels to understand your digital customer experience and looping behaviour. Use session replays to understand the 'why'.

Compare broken journeys by your cohorts or use CSQ to define new cohorts

Impact Quantification

Understand your key metrics, their prevalence, & how they are changing over time to prioritise fixes

Complete understanding of 'why' behind the customer behaviour

Components of experience analytics – from journey deep-dive to heatmaps, form analysis to session replays – granular insight into customer behaviour

Journey Deep-dive

Sense chat

I can show you relevant session replays that match your current journey analysis of users coming from Google Ads paid search. This will help you visually understand how these users navigate through your site and where they're exiting.

10 replays were summarized

Key insights

• Most users arrive via Google Ads, landing directly on either product detail pages or category pages, and tend to browse only a few pages per session, indicating focused shopping intent.

• Sessions with deeper exploration (more than 5 pages) frequently involve navigation between product listings and individual product pages, with repeated use of the menu and search features, suggesting users compare products before making a decision.

• Several sessions showed users spending significantly longer than average on some product pages (e.g., 'Puma Mirage Mox EB' and 'Puma Mirage Mox EB'), and interacting with buttons multiple times, which may signal confusion or issues with add-to-cart or selection functionality.

Potential issues

Product page buttons and interactive elements are often unresponsive, leading to user frustration and confusion. Immediately review and fix button responsiveness and interactive areas on product pages.

Slow page load times, especially on the homepage and search, cause poor first impressions and abandonment. Prioritize optimizing homepage and search page load times.

Message Sense...

AI can make mistakes. Check important info.

Error & Speed Analysis: Find, prioritize and fix errors

Quickly identify the errors and performance issues causing you revenue loss

Web

JavaScript Error Detection

Automatically capture every JS error across your site. See error rate, number of impacted users, and instantly jump to affected sessions.

Web + Mobile

API Error Monitoring

Track failed API calls with full context: endpoint, status code, response time, and the user journey around every failure.

Web

Custom Error Tracking

Define and monitor business-specific errors — payment failures, login errors, form validation — tied directly to conversion impact.

Mobile Apps

Crash Replay (Mobile)

When your app crashes, watch exactly what the user experienced before the crash. Get the stack trace + the session context in one view.

WHAT MAKES THIS UNIQUE

Revenue per error

Not just 'N users affected' — see the exact \$ revenue at risk for every error.

AI Error Summaries

Sense AI summarises the error, root cause hypothesis, and impacted journey in plain English.

1-click session replay

From error alert → affected session → technical details in one click. No reproduction needed.

Real-time alerts

Get notified the moment an error threshold is breached — before users complain.

Text Search

Search for any error message or on-screen text across all sessions.

Speed Analysis — Connect Performance to Revenue

Two modes: **RUM** (what real users experience) + **Synthetic** (lab tests + monitoring alerts)

REAL USER MONITORING (RUM)

Core Web Vitals — Live

LCP

Largest Contentful Paint

How fast the main content loads

INP

Interaction to Next Paint

How responsive the page feels

CLS

Cumulative Layout Shift

Visual stability (no layout jumps)

TTFB

Time to First Byte

Server response speed

🌟 Unique: Business context per metric

See how sessions with poor LCP score convert vs. sessions with good LCP. Revenue impact, not just a technical grade.

SYNTHETIC TESTING & MONITORING

Speed Analysis Lab

Speed Test Reports

Run on-demand tests on any URL. Measure load time, render timeline, and resource waterfalls.

Comparison Reports

A/B compare any two pages or deployments side-by-side to see performance delta.

Synthetic Monitoring

Set up continuous monitors for key pages and user scenarios. Get alerted the moment performance degrades.

Scenario Monitoring

Monitor multi-step flows (e.g., login → homepage → checkout) — not just single pages.

BUSINESS IMPACT VIEW

Compare sessions with fast vs. slow page loads on your homepage — see conversion rate, bounce rate, and revenue side by side. **Fix performance by ROI, not just milliseconds.**

Built-in AI to transform insight generation

- + Use AI CoPilot to get faster insights on Experience Analytics data
- + Designed to help all CSQ users from their onboarding to support deeper analysis
- + The AI translates natural language into the right events and analysis to answer your question
- + CoPilot can identify similar questions asked by others and highlights a set of up to 3 follow-up questions

✦ Sense Analyst

Customers are loving Sense Analyst

We are loving it... **This has made it so easy** to set stuff up and to get metrics.

Sense Analyst is a **real accelerator** for teams that aren't familiar with data.

It used to be the Chrome plug-in for ease of use but now it's the Sense AI tool.

Contentsquare's AI capabilities have been **game-changing** for us.

Connecting this data to the tools people use

Easily export data to combine data-sets and orchestrate campaigns at an organization level

Meeting you where you are on your agentic journey

Sense Analyst

Turnkey AI agent built into CSQ that helps novice users to onboard to analytics quickly and proactively surfaces insights tailored to *your* context.

Example: Weekly marketing campaign summary

MCP

Expose CSQ analytics data directly to **your AI agents**, driving automated workflows alongside any other data source you use.

Example: Agent that optimizes ad spend hourly based on landing page performance

Data Connect

Send raw, governed dataset directly to your warehouse to fuel **your custom AI models**, from fraud detection to downstream reporting.

Example: ML pipeline for product recommendations
