StatusNeo

RFP VERSION 1.0

SUBMITTED TO: INTERGLOBE AVIATION LIMITED (INDIGO)

AI-Enabled ITSM Managed Services

for IndiGo's **D**igital **R**eliability **C**ommand **C**entre

A 3-year strategic partnership to transform IndiGo's digital operations from reactive incident management into a fully AI-orchestrated reliability engine, protecting booking conversion, NPS, and revenue at scale, 24×7×365. Powered by the StatusNeo Enterprise OS Fabric.

40%+	99.9%	60%	21 FTE	5 AI Agents
MTTR Reduction by Q3 Year 1	Target Service Availability	Alert Noise Reduction	Command Centre Core Team	Declining Unit Cost Engagement by Year 3

CONTRACT DURATION
April 2026 – March 2029

ENGAGEMENT MODEL
Fixed-Fee Managed Services

PREPARED BY
StatusNeo Technology Consulting Pvt. Ltd.

01. EXECUTIVE SUMMARY

STRATEGIC COMMITMENT · ENTERPRISE OS FABRIC

StatusNeo

Transforming IndiGo's Digital Operations into an AI-Orchestrated Reliability Engine

This is not a staffing-led engagement. It is a strategic, outcome-oriented commitment to own, operate, and continuously enhance IndiGo's digital reliability posture — powered by the StatusNeo **Enterprise OS Fabric**, an integrated operational intelligence platform connecting AI-driven operations, engineering excellence, data observability, and talent continuity into a single coherent system.

AIOPS ENGINE

Autonomous detection, triage, RCA, and remediation across all incident dimensions

ENGINEERING INTELLIGENCE

Production signals wired directly into sprint planning and delivery quality gates

OBSERVABILITY MESH

Unified telemetry across web, mobile, APIs, payments, and infra in a single pane

KNOWLEDGE COMMONS

Living institutional memory that compounds with every resolved incident

WHAT WE ARE COMMITTING TO DELIVER

- 24×7 AI-Enabled DRCC from Gurgaon — 21 FTE with full P1–P4 SLA accountability from Day 1
- Five Agentic AI agents embedded across detection, triage, RCA, remediation, and learning
- Zero-disruption transition using shadow-absorb-own methodology with IndiGo gate sign-offs
- Measurable Year-on-Year efficiency gains with compounding automation coverage
- 55%+ repeat incident reduction by Year 3 through the Learning Agent's institutional memory
- Fixed-fee managed services — no per-incident charging, no T&M, no headcount shock

"StatusNeo is not proposing to support your systems. We are proposing to run your digital reliability — with AI at the core, humans where it matters, and measurable improvement built into the contract from day one. Powered by the StatusNeo Enterprise OS Fabric, our engagement delivers not just ITSM, but integrated intelligence across your entire digital operations value chain."

24×7
Gurgaon Command Centre from Day 1

5
Specialised Agentic AI Agents

21 FTE
Core Command Center Team

26–28
FTE-Equivalent Operating Capacity

StatusNeo

REVENUE-CRITICAL INFRASTRUCTURE

The Technology Stack We Will Own & Protect

IndiGo's digital ecosystem handles millions of transactions monthly. Any degradation has immediate material impact on booking conversion, NPS, revenue, and brand reputation.

LAYER	TECHNOLOGY	MONITORING APPROACH	KEY RISK AREAS
Web Frontend	.NET + React (Micro-FE on AEM)	Synthetic + RUM monitoring	AEM cache invalidation, CDN misses, React render failures
Mobile	React Native (iOS + Android)	Crash analytics + session replay	App Store deploy issues, OTA failures, FCM disruptions, Crashes
API Layer	REST/GraphQL APIs + Middleware	API gateway monitoring, latency dashboards	3rd-party timeout cascades, schema drift, rate limits
Payments	Payment Gateway Integrations	Transaction success rate monitoring	Gateway degradation, timeout, settlement failures
GDS / PSS	Airline system / GDS integrations	Availability + response time monitoring	SSIM, OAG, PSS system changes impacting bookings
Infrastructure	Cloud + CDN + Databases	Infrastructure health dashboards	DB connection pool exhaustion, CDN origin failures, Akamai issues

TRIAGE SPEED

Manual classification introduces critical- minute delays. AI Triage Agent resolves this from Day 1 of full operations.

RCA QUALITY

Senior engineer dependency creates inconsistency by shift. The Root-Cause Agent standardises hypothesis generation 24×7.

ALERT VOLUME

Multi-system alerts overwhelm teams. The Early-Warning Agent delivers 60%+ intelligent noise reduction.

NPS CORRELATION

Performance data and customer signals not systematically linked. NPS correlation framework live from Month 4.

Five Specialised Agents. One Intelligent Operations Hub.

AI executes the repetitive, time-critical, and data-intensive. Humans own decisions, accountability, and relationships, creating a system faster than purely human-led ops and safer than purely AI-driven automation.

EARLY-WARNING AGENT

Comparable: Dynatrace Davis AI / Datadog Watchdog

Runs continuously across all surfaces. ML-based anomaly detection predicts SLA breach before it occurs. Outputs pre-incident alerts with severity probability, affected user count, and recommended escalation path.

IMPACT
Reduction in P1 surprise incidents; earlier preventive action window

TRIAGE & CLASSIFICATION AGENT

Context-aware ML-based routing

Upon creation, enriches tickets with contextual data, classifies by category P1–P4 using business impact heuristics, routes to resolver group. SLA clock starts with AI-verified classification — eliminating manual first-response delay.

IMPACT
Eliminates minutes lost to manual classification on every P1

ROOT-CAUSE AGENT

Comparable: ServiceNow AIOps / Splunk ITSI

Correlates logs, metrics, distributed traces, deployment records, third- party status. Ranked RCA hypotheses with confidence scores. Operates during the incident, not after. IndiGo retains final RCA approval authority.

IMPACT
RCA becomes real-time, not a post- incident retrospective

REMEDIATION AGENT

Comparable: PagerDuty Automation / Rundeck

Executes pre-approved playbooks for known failure patterns. Confidence threshold gates — below threshold recommends, above threshold executes with notification. Never acts on novel incident types autonomously.

IMPACT
Service restarts, fallback routing, cache purge — governed, audited, reversible

LEARNING AGENT

Comparable: ServiceNow Knowledge Automation

Converts every resolved incident into institutional knowledge. Auto-generates KEDB entries, updates detection rules, creates regression test scenarios, adjusts ML model training data. The compounding value engine of the Enterprise OS Fabric.

IMPACT
30% repeat reduction by Year 1. 55% by Year 3.

AI Equivalency: *The five Agentic AI agents deliver 5–7 FTE of equivalent productivity — creating a* 26-28 FTE equivalent operating capacity from a 25 FTE human team. *Human-in-the-Loop governance is contractually embedded: IndiGo Digital Leadership retains final authority on all RCA approvals, SLA disputes, deployment decisions, and business communications.*

Every Priority Covered. No Distinction Between Outage and Severe Degradation.

Critical performance degradation is treated identically to functional outages in SLA measurement — because for IndiGo's passengers, slow is as damaging as down.

PRIORITY	BUSINESS IMPACT	RESPONSE SLA	RESOLUTION TARGET	STATUSNEO RESPONSE
P1 · CRITICAL	Booking/payment outage; full channel unavailability	≤ 15 Minutes	4 Hours	War-room mobilised immediately. Senior tech lead on bridge within 15 min. Live updates every 30 min.
P2 · HIGH	Partial service degradation, significant user impact	≤ 30 Minutes	8 Hours	L3 Technical Lead engaged immediately. RCA Agent activated in recommendation mode.
P3 · MEDIUM	Degraded experience, workaround available	≤ 2 Hours	24 Hours	L2 Engineer triages. Structured investigation. KEDB checked first for known patterns.
P4 · LOW	Minor issue, minimal user impact	≤ 4 Hours	72 Hours	Logged and queued. Resolved within service window with full documentation.

PERFORMANCE = P1 TREATMENT

Critical performance degradation treated identically to functional outages in SLA measurement. No distinction between "it's down" and "it's unacceptably slow."

HOURLY SMOKE TESTING

Automated smoke tests executed hourly across search, booking, payment, check-in, and boarding pass retrieval. Results published to IndiGo stakeholders in real time.

THIRD-PARTY SLA EXCLUSIONS

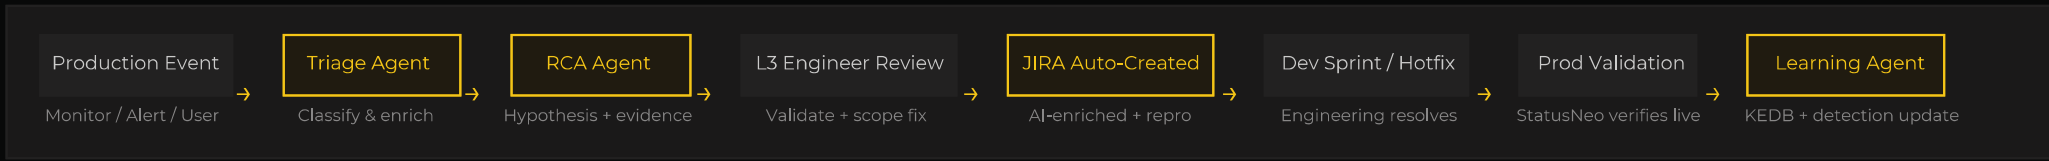

Incidents caused by payment gateway, GDS, or airline system outages are explicitly excluded from SLA penalty calculation. Vendor escalation paths pre-documented for all major integrations.

24×7 OPERATIONS DESIGN: Three 8-hour shifts with 30-minute overlap handover protocol. Minimum 3 engineers per shift at all times. On-call L3/P1 Technical Lead available within 15 minutes for P1 escalation at any hour, 365 days a year. Peak-period planning activated 6 weeks before Diwali, Christmas, summer peak, and IPL periods.

StatusNeo

The Intelligent Bridge Between Production and Development

Production intelligence must flow upstream to engineering as automatically and completely asmonitoring alerts flow downstream to operations.Every hour adefect sits unstructured costs engineering velocity.

AGENTIC JIRA TICKET CREATION

Every defect triggers an AI-generated JIRA ticket auto-populated with: incident ID linkage, environment/build version, error stack traces with symbolication, session replay reference, impacted API endpoints, correlated deployment events, NPS impact estimate, and suggested CAPA. Eliminates 30–40% of defect investigation time.

SPRINT INTELLIGENCE INTEGRATION

StatusNeo engineers participate actively in Scrum-of-Scrum meeting, not as observers but as contributors of production intelligence. Recurring defect patterns, performance regression trends, and KEDB insights brought into sprint ceremonies as structured data inputs. A strategic evolution beyond traditional ITSM.

BI-DIRECTIONAL SERVICENOW–JIRA SYNC

Webhook-based synchronization maintains continuous alignment between ServiceNow incident records and JIRA development tickets. Status changes, priority escalations, and resolution events propagate in both directions within 60 seconds
.

POST-DEPLOYMENT VALIDATION PROTOCOL

Every code fix validated in production before JIRA ticket closure. Automated smoke testing + 30-minute observation window per change. High-risk deployments: 4-hour window with dedicated DRCC engineer oversight. No fix declared complete until empirically verified in production.

StatusNeo

ACCELERATING FLYWHEEL — KNOWLEDGE → AUTOMATION → PREDICTION

Stabilise → Automate → Predict & Lead

Year 1 knowledge evolves into Year 2 automation. Year 2 automation transitions into Year 3 prediction. The unit cost decreases each year, while coverage and reliability grow driven by the compounding intelligence architecture of the Enterprise OS Fabric.

YEAR 1 · APR 2026 – MAR 2027

Stabilise & Establish

Investment Year · Foundation

- Full 25 FTE team deployed from Day 1
- Zero-disruption transition: shadow-absorb-own methodology
- Full 24×7 DRCC operational ownership by Week 17
- Enterprise OS Fabric Observability Mesh deployed by Week 20
- First 4 Agents live with pre-approved playbooks
- NPS correlation framework operational
- Month 12 QBR: MTTR vs Day-1 baseline, Year 2 roadmap

TARGET: ≥30% MTTR Improvement · KEDB ≥25% hit rate · ≥40% steps automated

YEAR 2 · APR 2027 – MAR 2028

Automate & Optimise

Efficiency Realised · AIOps at Scale

- Remediation Agent playbook library improves from Year 1 data
- Early-Warning Agent implemented
- Autonomous test generation from incidents deployed
- Performance regression detection automated in CI/CD pipeline
- Advanced ML-based NPS impact prediction operational
- Capacity planning module replacing manual pre-season assessments
- Monthly Model Performance Report added to governance cadence

TARGET: ≥45% repeat reduction · 15–20% per-incident cost ↓ · ≥55% steps automated

YEAR 3 · APR 2028 – MAR 2029

Predict & Lead

Structural Advantage · Self-Improving

- ≥40% of incidents intercepted before user impact by Early-Warning Agent
- Self-healing playbooks for all IndiGo-approved high-confidence scenarios
- All five agents at validated accuracy thresholds
- Flat team supports growing transaction volumes, no linear cost scaling
- Self-service observability deployed to IndiGo engineers
- 20–25% cumulative efficiency gain vs Year 1 investment
- 8 weeks structured retro initiated in Month 34 to plan the next journey

TARGET: ≥55% recurrence reduction · ≥99.95% availability · ≥65% steps automated

30%+	45%+	55%+	20%
MTTR Improvement Year 1	Repeat Incident Reduction Year 2	Recurrence Reduction Year 3	Per-Incident Cost Reduction Year 2

ZERO-RISK, ZERO-DISRUPTION · INDIGO GATE SIGN-OFF AT EVERY PHASE

StatusNeo

Shadow → Absorb → Own: Earned Through Gradual Process

Status Neo will not proceed to any phase without explicit IndiGo Digital Leadership sign-off. Gate criteria are formally defined and contractually embedded in the Statement of Work.

0 MOBILISATION — Foundation Setup
Weeks 1 –2

1 SHADOW & ABSORB — Observe & Capture
Weeks 3 – 4

2 ASSISTED OPERATIONS — Co-Pilot Mode
Weeks 5 – 12

3 FULL OWNERSHIP — Standalone Command
Week 13 → Month 12

Y1
APR'26 to MAR'27

Months 1 – 12

- ServiceNow, GitHub, JIRA, Firebase, AEM admin access provisioned
- RBAC + security onboarding per IndiGo OCP/Security protocols
- 90-day historical incident analysis — MTTR baseline + P1 frequency
- SLA matrix finalisation and governance framework sign-off
- Command Centre physical setup + Enterprise OS Fabric architecture design
- Shift roster confirmed; war-room tooling commissioned

Gate: Access provisioned · Governance signed · Baseline established

- StatusNeo engineers embedded alongside incumbent team
- All runbooks + tribal knowledge documented to quality standard
- AI agents in observe-only mode — building baseline ML models, zero actions
- Service dependency map created + validated against live traffic
- Critical incident playbooks authored + reviewed by IndiGo Digital Leadership
- Knowledge transfer verified: top 80% of incident categories tested

Gate: 80% incident categories documented · Dependency map validated

- StatusNeo assumes primary triage, incumbent provides backstop oversight
- Triage Agent activated: AI classification, human-reviewed before action
- RCA Agent in recommendation-only mode: L3 validates all hypotheses
- ServiceNow–JIRA automation live with AI-enriched defect ticket creation
- First independent P1 managed with IndiGo oversight (Phase 3 gate criterion)
- First KEDB entries + first Monthly Service Health Report delivered

Gate: First independent P1 successfully managed under IndiGo oversight

- Complete 24×7 standalone ownership — all SLAs active
- Incumbent formally stood down; StatusNeo fully accountable
- Remediation Agent live: pre-approved playbooks with confidence governance
- NPS correlation framework operational — first NPS-Operations report
- Observability Mesh fully deployed: Web, Mobile, APIs, Payments, GDS
- Month 12 QBR: MTTR vs Day-1 baseline; Year 2 roadmap confirmed

Gate: All SLAs active · Observability mesh live · Month 12 QBR delivered

YEAR 1 TARGETS

≥30%
MTTR Improvement vs Day-1 Baseline by Month 12

Week 13
Full standalone 24×7 ownership achieved

≥25%
KEDB hit rate by Month 12

≥40%
Incident lifecycle steps automated by Year end

RISK MITIGATION

PARALLEL OPERATIONS

StatusNeo engineers run alongside incumbent for minimum 8 weeks before assuming primary responsibility.

INCIDENT REPLAY PROTOCOL

Historical P1 and P2 incidents replayed with StatusNeo team to validate RCA competency before live exposure. No phase progression without validated competency demonstration.

NO-REGRESSION SLA

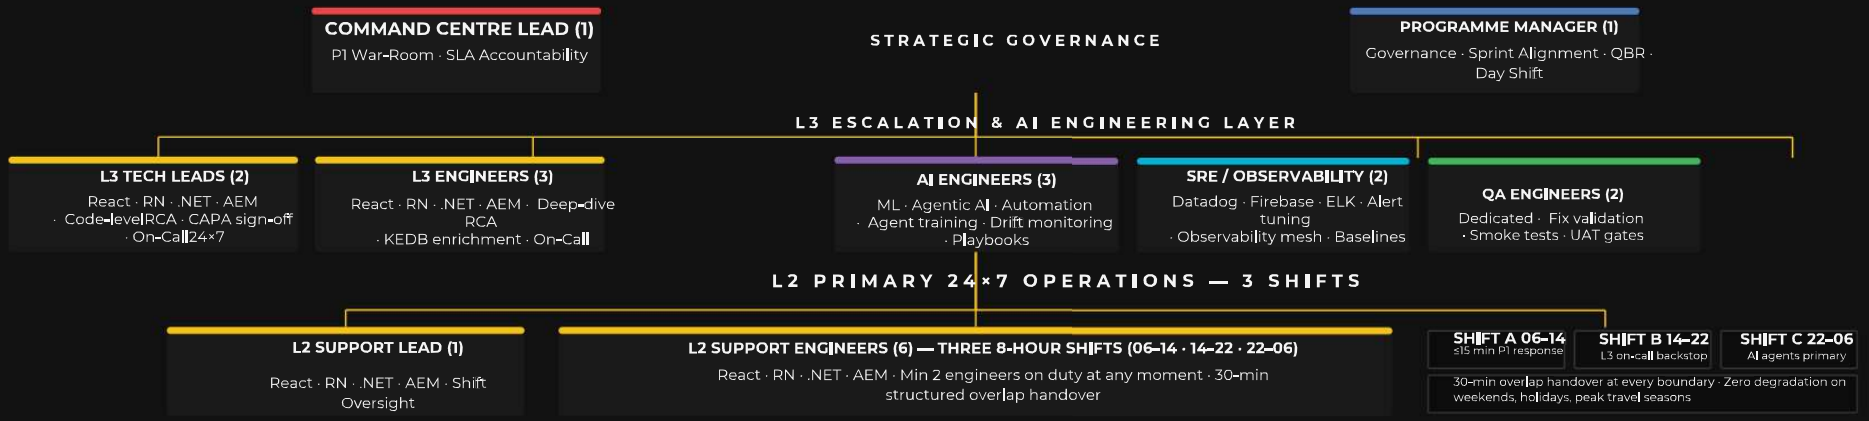

Any metric regression during transition treated as a critical programme risk requiring an immediate remediation plan. Conservative SLA targets in first 90 days with no-regression contractual clause.

09. TEAM STRUCTURE — 21 FTE COMMAND CENTRE

StatusNeo

Sized for Operational Depth, Not Minimum Viable Headcount

Every role carries a defined AI-augmented workflow. Minimum 3 engineers per shift at all times. On-call L3/P1 Technical Lead available within 15 minutes at any hour, 365 days a year.

21 HUMAN FTE

+ 5–7 FTE equivalent productivity via Agentic AI Agents = 26–28 FTE Total Effective Operating Capacity

Fixed-fee model · No per-incident charging · No headcount shock · Gurgaon HQ · Zero timezone friction with IndiGo leadership

AI AGENT LAYER (5 AGENTS): Early-Warning Agent → Triage Agent → Root-Cause Agent → Remediation Agent → Learning Agent · Each agent has confidence scores, manual override in 60 sec, cryptographic audit log

COVERAGE GUARANTEE: Three 8-hour rotations · L3 on-call ≤15 min P1 response at any hour · Min 2 L2 engineers on duty at any moment · Zero degradation on weekends, holidays, peak seasons

Note : The FTE count will be further optimised in Year 2 and Year 3 once we attain maturity on the process and desired automation from the 5 AI Agents

10. EXTENDED SUPPORT MODEL & KNOWLEDGE CONTINUITY

Knowledge Continuity as a Core Engineering Discipline

StatusNeo

Knowledge loss at engineer departure is the most common managed services failure mode. Status Neo eliminates this risk by design, treating institutional knowledge as a first-class engineering asset and not an afterthought

EXTENDED SPECIALIST SUPPORT

SPECIALIST RESOURCE	AVAILABILITY SLA	TRIGGER
Cloud Infra Specialists (AWS/Azure/GCP)	Within 1 hour for P1/P2	Infrastructure-layer RCA requiring cloud expertise
Security Operations Support	Within 2 hours for InfoSec events	Security incident, access anomaly, compliance audit
Payment Gateway Integration Specialists	On-demand during active P1	Payment success rate degradation, gateway timeout
GDS / PSS Integration Leads	On-demand for P1/P2	PSS or GDS-related booking failures
App Store / Play Store Release Engineering	Within 4 hours	App Store rejection, critical OTA failure
AEM Platform Specialists	Within 2 hours for P1/P2	Cache invalidation, AEM dispatcher issues
StatusNeo Practice Leadership (CTO Office)	All P1 post-incident reviews; QBR	P1 post-incident quality gate; QBR strategic review

STRUCTURAL KNOWLEDGE ARCHITECTURE

All operational knowledge maintained in ServiceNow & not in individuals' heads. Four layers: Operational Runbooks, Technical Playbooks, KEDB, and Institutional Context. New engineers operationally effective within 10 working days & not the 60–90 days typical of unstandardised managed services.

CROSS-TRAINING & COVERAGE REDUNDANCY

Minimum two-engineer cross-training for every critical system area without exception. Formally tracked, tested quarterly through scenario exercises, and reported in Monthly Service Health Reports.

30-DAY SUCCESSION PROTOCOL

Any departure triggers immediate structured succession. Designated successor identified within one week. Daily knowledge transfer sessions, documented handover, supervised first-response period. Progress reported weekly to IndiGo Digital Leadership.

CONTRACT-END COMMITMENTS

1 Full runbook library, KEDB archive, AI agent configuration documentation, integration architecture specs up to date, re-structure of team basis the current state then, and optimise for ROI in mutual consensus with IndiGo leadership.

11. KPI FRAMEWORK & OPERATIONAL TARGETS

Primary Data Only. No Self-Reporting. No Retro Redefinition.

StatusNeo

All KPI reports generated from ServiceNow audit trail. MTTR, response time, availability, and classification accuracy calculated from primary operational data. KPI definitions and targets to be aimed at the start.

≤15 min
P1 Response Time
Year 3 Target ≤ 10 mins

≥99.9%
Service Availability
Year 3 Target ≥ 99.95%

≥80%
Triage Classification Accuracy
Year 3 Target ≥ 92%

≥40%
Incident Steps Automated
Year 3 Target ≥ 60%

KPI CATEGORY	METRIC	YEAR 1 TARGET	YEAR 3 TARGET
Incident Response	P1 Response Time	≤15 min (100%)	≤10 min (100%)
Incident Response	P2 Response Time	≤30 min (100%)	≤20 min (100%)
Resolution	MTTR Improvement vs Baseline	≥30% improvement	≥50% improvement
Availability	Service Availability	≥99.9%	≥99.95%
SLA Compliance	Overall SLA Adherence	≥95%	≥98%
AI Performance	Triage Classification Accuracy	≥80%	≥92%
AI Performance	RCA Hypothesis Accuracy (L3 validated)	≥70%	≥88%
Prevention	Alert-to-Incident Conversion Rate	≥75%	≥90%
Problem Management	Repeat Incident Recurrence Reduction	≥30% vs baseline	≥55% vs baseline
Automation	Incident Lifecycle Steps Automated	≥40% of steps	≥65% of steps
Customer Experience	NPS-Correlated Incident Identification Rate	≥60% of low-NPS periods	≥85% of low-NPS periods
Knowledge	KEDB Hit Rate (resolved via KEDB)	≥25%	≥50%

12. GOVERNANCE, COMMUNICATION & ESCALATION MATRIX

Governance Model & External Escalation paths

StatusNeo

OPERATIONAL ESCALATION — P1/P2 INCIDENT RESPONSE

LEVEL	TRIGGER	STATUSNEO	INDIGO	SLA
L1 · IMMEDIATE	P1 declared — booking/payment outage, critical security event	L2 + L3 war-room lead + CC Lead notified	Digital Ops Lead + Digital Leadership bridge within 15 min	L3 on bridge: ≤15 min · First update: ≤30 min
L2 · HIGH	P2 significant user impact; P1 unresolved at 2-hour mark	CC Lead assumes direct ownership; Engagement Lead notified	Digital Leadership notified; vendor escalation paths activated	CC Lead response: ≤ 30 mins EL notification: ≤ 1 hour
L3 · ELEVATED	P1 unresolved at 4- hour mark; SLA breach risk; NPS-correlated silent incident	Engagement Lead assumes accountability; Practice Leadership notified	IndiGo VP/Director of Digital notified; executive comms considered	EL response: ≤ 1 hour Practice Lead: ≤ 2 hours
L4 · EXECUTIVE	Sustained SLA breach ≥3 months; contractual dispute; major security incident	StatusNeo CTO/CEO; formal executive briefing provided	IndiGo CTO/SVP Technology; formal executive review	Executive ack: ≤4 hours · Formal briefing: ≤24 hours

GOVERNANCE CADENCE

FORUM	CADENCE	PURPOSE
Real-Time DRCC Dashboard	24×7 Live	P1/P2 status, SLA traffic lights, open incident count
Daily Operations Standup	Daily · 15 min	Overnight events, open risks, day's priorities
Weekly Operational Review	Weekly	SLA scorecard, MTTR trends, backlog prioritisation

DECISION AUTHORITY MATRIX

DECISION DOMAIN	AUTHORITY
P1 War-Room Leadership	StatusNeo CC Lead + IndiGo Digital Leadership
RCA Approval (Final)	IndiGo Digital Leadership
SLA Dispute Arbitration	IndiGo Digital Leadership
Deployment Approval	IndiGo CAB Authority
Automated Remediation Activation	AI agent (pre-approved only) + Human notification
Audit & Compliance Sign-off	StatusNeo Security Lead + IndiGo InfoSec

EXTERNAL PARTIES ESCALATION PATH

SCENARIO	SLA
Payment gateway P1 — vendor escalation path pre- documented per gateway	Vendor contact: ≤30 min
GDS/PSS connectivity failure — GDS/PSS vendor NOC escalation	PSS contact: every 30 min
App Store/Play Store rejection — Apple/Google developer escalation	Platform escalation: ≤2 hours
Security incident — IndiGo InfoSec notification; regulatory assessment	IndiGo InfoSec: ≤15 min from suspicion

This governance model establishes a clear, time-bound incident escalation framework with defined ownership, authority, and SLAs from immediate operational response through executive intervention. It ensures rapid decision-making for critical incidents, structured accountability across leadership levels, and seamless coordination with external partners (vendors, PSPs, cloud providers). The model is reinforced by regular governance cadences to maintain operational readiness, compliance, and service stability.

13. NON-FUNCTIONAL REQUIREMENTS RESPONSE - SECTION 4 OF RFP

Every NFR Has a Specific, Measurable Commitment with Tooling and Governance

StatusNeo

AVAIL Service Availability — 24×7×365 Operations

≥99.9% Year 1, ≥99.95% Year 3. Minimum 3 engineers on shift at all times. On-call L3 within 15 minutes. Measured from synthetic monitoring uptime , not self-reported. RPO: 4 hours. RTO: 2 hours. DR tested annually.

Monthly measurement | SLA scorecard | Synthetic uptime only

SCALE Scalability — Elastic Coverage Without Linear Cost

No hard limits on alert volume, ticket count, or monitoring throughput. Peak planning activated 6 weeks before Diwali, Christmas, summer peak, IPL. AI agent processing scales horizontally without headcount addition.

Annual capacity forecast 90 days prior | Peak SLA preserved

PERF AI Triage Performance — Near-Real-Time

Triage Agent classifies incidents within 30 seconds. Alert correlation within 60 seconds. RCA Agent initial hypothesis set within 5 minutes of P1 declaration. ServiceNow dashboards load within agreed SLA at P95.

P95 thresholds monitored continuously | Monthly performance SLA report

SEC Security — Zero Trust, Least Privilege

RBAC enforced. CyberArk PAM (or similar) for all privileged access: sessions recorded, time-limited (max 4-hour sessions with re-approval), fully auditable. BGV mandatory for all personnel before production access. Two-person integrity required for all high-privilege operations.

ISO 27001 aligned | Quarterly access audit | BGV mandatory

PII Data Privacy & PII Protection

GDPR + DPDP Act 2023 compliance. PII masking at ingestion layer for passenger names, emails, payment card data, passport numbers. AES-256 at rest; TLS 1.3 in transit. Data residency: India-based infrastructure only. Right-to-erasure within 72-hour SLA.

DPDP Act 2023 aligned | Monthly PII audit log review

AIML AI Model Reliability — Explainability & Override

All AI agent decisions explainable with confidence scores. Manual override for any automated decision within 60 seconds. Version control and rollback for all automation within 30 minutes. Model performance reviewed monthly. Confidence thresholds jointly agreed with IndiGo Digital Leadership.

Human override ≤60 sec | Monthly accuracy report | Joint threshold governance

DRIFT Model Drift Detection & Continuous Training

Drift monitored continuously via statistical distribution analysis (p<0.05 threshold). Retraining initiated within 5 business days of confirmed drift. Minimum quarterly full retraining. Rollback to previous model within 2 hours if post-deployment performance degrades. Model training data scoped exclusively to IndiGo operational data.

p<0.05 drift threshold | Quarterly full retraining

INTEG Integration Architecture — Standards-Based

All integrations via REST API + OAuth 2.0. ServiceNow ↔ JIRA: bi-directional webhook, 60-second sync. All integration credentials in PAM vault — no hardcoded secrets.

All integrations documented | Health in daily digest

LOG Comprehensive Logging & Audit Trail

Every AI agent action logged with confidence score, triggering condition, playbook version, and outcome. Audit logs tamper-evident: write-once storage with cryptographic integrity verification. On-demand audit reports within agreed business hours

Tamper-evident storage | On-demand | 7-year security log retention

MAINT Maintainability — Configuration-First

All SLA thresholds, routing rules, escalation paths, and dashboard layouts managed via ServiceNow configuration, with no code changes for operational adjustments. Monthly patch cycle with 2-week advance notice. Self-service admin training for IndiGo Digital Ops in Weeks 3–8.

SUMMARY

This framework defines clear, measurable Non-Functional Requirements (NFRs) across availability, scalability, performance, security, data protection, and auditability. It ensures systems are resilient, secure, observable, and compliant, with built-in monitoring, automation, and governed AI/ML controls. Each NFR is backed by explicit SLAs, tooling, and ownership, enabling predictable operations and controlled risk at scale.

StatusNeo

Operating on IndiGo's Existing ServiceNow. Augmented by our Proprietary Enterprise OS Fabric

All integrations use REST API patterns with OAuth 2.0 authentication. Integration architecture documentation produced before IndiGo OCP/Security team prior to moving to full Mobilisation/Command phase

ITSM PLATFORM

ServiceNow (IndiGo existing instance). Incident, Problem, Change, KEDB modules. Bi-directional JIRA integration via webhook-triggered REST API with 60-second sync latency.

AGENTIC AI ORCHESTRATION

StatusNeo Proprietary AI Layer. Five specialised agents with confidence threshold governance. Not a vendor product licence. Customisable to IndiGo's stack. Continuously improved throughout contract.

WEB OBSERVABILITY

DataDog APM + AEM Performance Monitoring. Core Web Vitals (LCP, FID, CLS), API response times, per-endpoint SLA tracking, CDN analytics and edge performance

MOBILE OBSERVABILITY

Firebase Performance + Crash Analytics + DataDog RUM. App launch time, session flow analysis, crash symbolication, code-level stack trace, OTA update health tracking for React Native bundles.

LOG MANAGEMENT

ELK Stack / Splunk. Centralised log aggregation with ML-based anomaly detection. Alert de-duplication and intelligent correlation for actionable signals only.

SYNTHETIC MONITORING

Automated synthetic testing hourly across booking, payment, check-in, boarding pass retrieval. Results published to IndiGo stakeholders within 5 minutes of completion.

ALERT MANAGEMENT

PagerDuty / OpsGenie or similar for alert routing with AI noise reduction. Teams integration for real-time P1 bridge communication and stakeholder notifications.

REPORTING & BI

ServiceNow Performance Analytics + Custom Power BI dashboards. Role-based views for Operations, Management, Leadership. Drill-down by app, severity, category. PDF/Excel/PPT export.

SECURITY & PAM

CyberArk PAM or similar. All production access sessions recorded, time-limited (max 4 hours with re- approval), and fully auditable. SSO per IndiGo standards.

DEFECT TRACKING

JIRA bi-directional integration. Auto-populated defect tickets with RCA evidence, reproduction steps, stack traces, session replay refs, NPS impact estimate, and suggested CAPA.

SOURCE CODE ACCESS

GitHub read-only via token-scoped API for RCA deployment history correlation. No direct commit access. All code changes executed by IndiGo Delivery team through JIRA process.

ALL CREDENTIALS IN PAM VAULT OR SIMILAR

No hardcoded secrets in any configuration. All integration credentials managed in PAM vault (or similar). Integration health monitored and included in daily operations digest.

StatusNeo

Operational Risk Managed by Design, Not Reaction

RISK	LIKELIHOOD	STATUSNEO CONTROL MEASURE
Over-automation causing incorrect remediation	MEDIUM	Confidence threshold gates on all automated actions. Novel incident types excluded from automation. Human approval required for first 10 executions of any new playbook. Full audit trail of every automated action. Manual override within 60 seconds at any time.
RCA dispute between StatusNeo and IndiGo	LOW	IndiGo Digital Leadership is contractually defined final authority on all RCA approvals. Dispute escalation path formally documented and signed off at contract execution. No escalation to third-party arbitration without IndiGo's initiation.
SLA breach during transition period	MEDIUM	Phased transition with gate sign-offs. Incumbent on defined retainer during Phase 2. Conservative SLA targets in first 90 days with contractual no-regression clause. Any metric regression treated as critical programme risk requiring immediate remediation plan.
Third-party dependency causing extended P1	MEDIUM	Early-Warning Agent monitors third-party health continuously. Vendor escalation paths pre-documented for all major integrations. Explicit contractual exclusion of third-party resolution time from SLA penalty calculation.
Key personnel attrition	LOW	Minimum 2-person cross-training per critical system area. 30-day succession protocol activated immediately on any departure. All knowledge in ServiceNow KB verified annually. Internal mobility from StatusNeo's practice network is first recourse before external recruitment.
AI model drift reducing accuracy	LOW	Drift monitored continuously ($p<0.05$ threshold). Retraining within 5 business days of confirmed drift. Version control and rollback for all models within 2 hours. Monthly accuracy reports. Manual override always available.
Peak season traffic overload	MEDIUM	Pre-season capacity review 6 weeks before Diwali, Christmas, summer peak, IPL. Synthetic load testing. Pre-approved scaling protocol. P1 war-room pre- briefed and on standby before all major travel peaks. Annual capacity forecast provided 90 days before contract year start.
Security breach via production access	LOW	All personnel complete BGV before production access. PAM tool for all sessions — recorded, time-limited (max 4 hours), auditable. Quarterly access review. Deprovisioning within 24 hours of role change or departure. Two-person integrity required for all high-privilege operations.

Transforming ITSM from a Cost Function into a Strategic Competitive Capability

These value-adds are not optional add-ons. They are structurally embedded in the engagement model and delivered within the fixed-fee commercial framework—direct expressions of the Enterprise. OS Fabric's core principles: observe everything, automate confidently, decide intelligently, improve continuously.

UNIFIED OBSERVABILITY MESH

A single-pane observability layer across web, mobile, APIs, payments, and infra & not separate tool silos. Correlates signals across all surfaces in real time, enabling incident correlation that tool-by-tool approaches systematically miss.

PREDICTIVE NPS INTELLIGENCE

ML-based correlation between session performance metrics and NPS outcomes, enabling pre-emptive action before customer dissatisfaction crystallises into detractor scores. NPS transformed from a lagging report into a real-time reliability signal.

SPRINT INTELLIGENCE INTEGRATION

Production reliability data embedded directly into IndiGo's engineering sprint ceremonies. KEDB-derived technical debt priorities, incident patterns, and regression trends provided as structured sprint inputs, hence closing the feedback loop that traditional ITSM never achieves.

AUTONOMOUS TEST GENERATION

The Learning Agent generates regression test scenarios from production incidents automatically. Scenarios enriched with real failure conditions, reproduction steps, and environmental context are delivered directly to IndiGo's QA pipeline. Fewer regressions. Faster fix validation cycles.

REVENUE IMPACT QUANTIFICATION

Every incident assessed against IndiGo's booking conversion data to produce a real-time revenue exposure estimate. P1 war-rooms briefed with revenue impact numbers & not just technical impact descriptions. Executives receive incident communications in business terms, not engineering terms.

PROACTIVE VENDOR RISK INTELLIGENCE

Continuous monitoring of third-party dependency health (payment gateways, GDS, CDN, cloud services) with early-warning signals and pre-staged escalation paths. Vendor health trends reported quarterly with recommendations for dependency risk reduction.

THE 3-YEAR VALUE COMPOUNDING THESIS

Every incident resolved in Year 1 trains the AI models that automate responses in Year 2. Every automation deployed in Year 2 reduces the recurrence rate that drives Year 3 cost efficiency. Every KEDB entry enriched by the Learning Agent reduces the engineering effort required to resolve the next occurrence.

IndiGo is not buying three years of managed services at a fixed price. It is investing in an operational intelligence system that becomes more valuable, more capable, and more cost-efficient with every month of operation. Year 1 is the highest investment. Year 3 delivers the highest value at the lowest unit cost.

StatusNeo

STRATEGIC · OPERATIONAL · ECONOMIC EVALUATION DIMENSIONS

IndiGo Is Not Buying Support Hours. This Is a Strategic Decision About Who Protects Your Digital Revenue Engine.

The right partner for this engagement must be evaluated on strategic differentiation, operational accountability, and economic logic & not just technical capability checkbox responses.

01
AI-FIRST DESIGN — NOT AI-ADDED

Proprietary five-agent Agentic AI framework purpose-built for ITSM & not a vendor product licence with generic capabilities. Built by StatusNeo, customisable to IndiGo's exact stack, continuously improved by our dedicated AI engineering team throughout the 3-year engagement. The **Enterprise OS Fabric** is the operational backbone & not a dashboard add-on.

02
OUTCOME ACCOUNTABILITY MODEL

Fixed-fee managed services with outcome accountability. StatusNeo's commercial model structurally improves as automation reduces incident volume. Our incentive is to prevent incidents, not maximise ticket counts. No per-incident charging. No headcount shock as IndiGo scales.

03
ZERO-RISK TRANSITION METHODOLOGY

Shadow-absorb-own transition with IndiGo gate sign-offs at every phase. No big-bang cutover. No single day of exposure. StatusNeo earns operational ownership through demonstrated capability, and a gate criteria requires IndiGo Digital Leadership approval before any phase progression.

04
GURGAON LOCATION ADVANTAGE

Command Centre in the same city as IndiGo HQ. Direct relationship with Digital Leadership. Zero timezone friction. Physical proximity enables faster relationship building, easier governance integration, and alignment with IndiGo's escalation culture. No remote-first delivery risk.

05
AVIATION-STACK SPECIFICITY

Deep hands-on experience in AEM, React, React Native, Firebase, DataDog, OCP, payment gateways, and GDS integrations, and not generic ITSM applied to aviation. We understand the non-negotiable reliability requirements of travel booking platforms, the PSS/GDS integration landscape, and the revenue impact of digital degradation for India's largest carrier.

06
3-YEAR COMPOUNDING VALUE LOGIC

Year 1 stabilises. Year 2 automates. Year 3 predicts. Unit cost declines year-on-year. No headcount shock. Institutional knowledge retained and compounding. AI-augmented model grows with IndiGo's digital complexity without proportional cost increase. The Enterprise OS Fabric ensures IndiGo permanently owns the operational intelligence built during the engagement.

N O T E S AND ASSUMPTIONS

- Day Rate Band: ₹11,187/day (2–5 yrs) · ₹13,189/day (5–10 yrs) · ₹14,785/day (10+ yrs)
- Annual working days: 22 days/month × 12 months = 264 days per FTE
- Year 2 applies 5% efficiency reduction on Year 1 managed support cost (automation gains)
- Year 3 applies further 5% on Year 2 (cumulative ~10% reduction vs Year 1)
- L2 Team: 1 CC Lead (Day+On-Call) + 6 L2 Engineers (3-shift rotation, 2 per shift)
- L3 Team: 2 Leads (On-Call 24×7) + 3 Tech Engineers (On-Call 24×7) ≤15 min P1 SLA
- QA Engineers are shared across L2 operations, L3 escalation and AI Engineering pods
- Costs exclude: License Subscription · Implementation · Customization · Any Other Cost

Note - we will be using the existing agentic infrastructure available at IndiGo, e.g. Microsoft AI Foundry, hence no separate cost has been added

19. RFP MAPPING AND COVERAGE

StatusNeo

How we cover Every RFP mandate

Full Compliance . Functional & Non-Functional . AI-Native Delivery

IndiGo operates India's highest-frequency domestic network. Every second of digital downtime translates directly into lost booking revenue, degraded NPS, and passenger experience failures at scale. This matrix documents StatusNeo's point-by-point response to every IndiGo RFP requirement — powered by Authentic AI™ and the Enterprise OS Fabric™, engineered for airline-grade reliability with zero compromise.

AUTHENTIC AI™ ENTERPRISE OS FABRIC™

FUNCTIONAL REQUIREMENTS — SECTION 3 OF RFP

RFP REF	REQUIREMENT	STATUSNEO DELIVERY APPROACH & AIRLINE-CONTEXT COMMITMENT	POWERED BY	✓
3.1	Incident Intake Multi-source ingestion	ServiceNow, monitoring alerts, REST API, email, agent console. GDS & PSS alert sources natively integrated — no blind spots across IndiGo's booking and ops stack. Standardised data schema enforced at entry point.	ServiceNow · Triage Agent · Custom API	✓
3.2	Automated Triage AI classification & enrichment	ML-based Triage Agent classifies by category, priority, and resolver group within seconds. Confidence scores visible — human override always enabled. Authentic AI: no black-box decisioning on IndiGo's critical path.	Triage Agent · NLP Pipeline · KEDB	✓
3.3	Priority-Based Mgmt P1–P4 SLA workflows	P1–P4 calibrated to IndiGo business impact. P1 war-room within 15 mins. Pre-season peak protocols activated before Diwali, summer, and long weekend windows — treating flight-peak traffic like a scheduled ops event.	ServiceNow · Triage Agent · Escalation Engine	✓
3.4	Root Cause Analysis Automated RCA + CAPA	Root-Cause Agent generates RCA hypotheses in real time. Full CAPA doc, searchable repository, KEDB enrichment. GitHub read-only API correlates deployments with incident timelines — airline-grade forensic rigour, every P1.	Root-Cause Agent · KEDB · GitHub API	✓
3.5	Problem Management Pattern detection & KEDB	Learning Agent auto-detects recurring incident signatures →, Problem records. KEDB maintained with AI workarounds. Problem →incident →change linkage ensures no issue recurs without a permanent fix. Every problem has a remediation plan — like every flight has a flight plan.	Learning Agent · ServiceNow Problem	✓
3.6	ITSM Workflow Automation End-to-end lifecycle	Enterprise OS Fabric™ is the operational backbone connecting all workflow automation. All automation version-controlled, rollback-capable, and self-documenting. CAB governance respected — no automation bypasses IndiGo's change approval process.	OS Fabric™ · ServiceNow · JIRA API	✓
3.7	Delivery Integration JIRA bi-directional sync	Auto JIRA creation with RCA evidence, stack traces, session replay refs, NPS impact estimate, and CAPA recommendation. Bi-directional sync — IndiGo Delivery team has zero ambiguity on action owners and timelines. Post-deployment validation prevents regression.	JIRA Bi-Sync · Triage Agent · PAM Vault	✓
3.8	Monitoring & Alert Correlation AIOps predictive alerting	Early-Warning Agent correlates Datadog, Firebase, Splunk, APM. ≥60% alert noise reduction. Predictive alerting surfaces anomalies before passengers are impacted — detecting engine variance before it becomes a flight delay.	Early-Warning Agent · Datadog · Splunk	✓
3.9	Web & Mobile Performance Full-stack perf management	RUM, Synthetic monitoring, Crash Analytics, Core Web Vitals. Performance degradation on indigo.com or 6E app = P1 treatment. Deep expertise in AEM, React Native, and Firebase — not generic ITSM applied to aviation.	RUM · Synthetic · Firebase · AEM	✓
3.10	Stakeholder Communication Real-time dashboards	Role-segmented dashboards: Operations, Management, IndiGo Digital Leadership. Automated SLA-breach notifications. Executive P1 summaries structured for leadership — not raw logs. All communication cadences contractually committed.	ServiceNow · Power BI · Governance Layer	✓
3.11	Reporting & Analytics SLA, MTTR, trends, export	Full KPI framework: SLA compliance, MTTR/MTTD trending, incident heatmaps, automation rate progression, cost-per-incident trajectory. Drill-down by app/severity/category. Export-ready without vendor dependency. QBRs on IndiGo's governance calendar.	ServiceNow Analytics · Power BI	✓
3.12	Knowledge Management AI-generated KB, CI tracking	Learning Agent auto-generates KB articles from every resolved incident. AI-recommended solutions surface at triage — reducing engineer MTTR. IndiGo permanently owns all operational intelligence built during this engagement.	Learning Agent · ServiceNow KB	✓
3.13	Governance & Audit RBAC, audit trail, compliance	Tamper-evident audit trail. RBAC with least-privilege — BGV mandatory before any production access. SSO per IndiGo standards. All credentials in PAM vault — zero hardcoded secrets. On-demand audit reports for OCP/Security/Delivery protocols. ISO 27001 aligned.	RBAC · PAM Vault · SSO	✓

NON-FUNCTIONAL REQUIREMENTS — SECTION 4 OF RFP · ALL 13 NFRS: COMPLIANT

AVAILABILITY · SCALABILITY · PERFORMANCE (4.1–4.3)

- ≥99.9% service availability — 24×7×365 DRCC, Gurgaon-based, zero timezone friction with IndiGo HQ
- Elastic AI agent model — scales with peak season traffic; no hard volume limits; pre-season war-room protocol
- Sub-second triage classification — near-real-time alert correlation via Early-Warning Agent
- Dashboard SLA compliance — role-based views load within committed response windows

SECURITY · PRIVACY · INTEROPERABILITY (4.4–4.6)

- RBAC + least privilege — all prod access gated by BGV, SSO, and IndiGo OCP approval protocols
- Encryption at rest and in transit — Prod/Non-Prod isolation; PII masked in all logs and dashboards
- GDPR + Indian DPA aligned — configurable retention; data never leaves IndiGo's designated environment
- Native integrations via REST APIs — ServiceNow, JIRA, GitHub, AEM, Firebase; zero proprietary lock-in

AI RELIABILITY · DR · AUDIT · SUPPORTABILITY (4.7–4.13)

- Authentic AI governance — explainable models, confidence scores, manual override always available · statusneo.com
- Documented RPO/RTO — KEDB and config backed up independently; regular DR testing on schedule
- Configuration-first — minimal custom code; IndiGo self-service for SLA, routing, and dashboards
- End-to-end audit trail — every automation and user action logged; on-demand report generation

Every RFP requirement has a named owner, a deployed technology, and a measurable outcome. No mandate is met by intent alone.

StatusNeo's Authentic AI™ framework (statusneo.com) ensures AI decisions are transparent, auditable, and override-capable at every layer. The Enterprise OS Fabric™ connects all 13 functional requirements into a single self-improving operational loop, so IndiGo's digital reliability compounds year-on-year. Digital Reliability is not a cost function. It is IndiGo's competitive advantage. StatusNeo is ready to own it.

STATUSNEO × INDIGO · A 3-YEAR STRATEGIC PARTNERSHIP

StatusNeo

Ready to Own Your Digital Reliability

24×7 Command Center from Gurgaon · Five Agentic AI Agents · 21 FTE Senior Team · Enterprise OS Fabric

OUR NON-NEGOTIABLE PARTNERSHIP COMMITMENTS

- We will never allow automation to compromise safety, security, or governance. Every AI action is governed, audited, and reversible.
- We will be transparent about what is working and what is not. Monthly model performance reports are operational accountability documents & not marketing material.
- We will not scale our costs as IndiGo scales its business. Our model delivers improving unit economics as automation matures, the opposite of every staffing-led alternative.
- We will proactively surface risks before they become incidents. The Early-Warning Agent is an investment in IndiGo's future, not a feature add-on.
- We will treat IndiGo's digital infrastructure with the same care that IndiGo's engineers do. Production access is a privilege we will protect.

20. WHY STATUSNEO IS A PARTNER OF CHOICE

No One Knows IndiGo Like Us. No One Can Deliver Like Us.

4+ YEARS ACTIVE | ODC SEC-32 GURGAON | 6+ LIVE DOMAINS

StatusNeo

01 · TRUST & CONTINUITY

4+ Years. IndiGo Is Our Family.

- Dedicated ODC at Sector-32, Gurgaon, same campus, same timezone as IndiGo HQ
- Leadership personally invested, not just the account P&L, but IndiGo's success
- Deep institutional trust built over hundreds of P1s, releases, and escalations together

Zero KNOWLEDGE TRANSFER OVERHEAD ON DAY 1

02 · FULL-STACK OWNERSHIP

We Already Own Your Stack.

- Running entire WnM delivery — Web, Mobile (React Native), MS, OCP, DCC, AEM Authoring
- Complete mobile app ownership — the final product is 100% managed and delivered
- Datadog DCC observability team embedded and already LIVE, not a proposal, a live operation

6+ ACTIVE INDIGO DOMAINS DELIVERED TODAY

03 · DRCC INTELLIGENCE

We Wrote The DRCC Runbooks.

- Built and operate DRCC observability architecture — Datadog, Firebase, ELK, every alert rule
- Product Management ownership — P1 flows, KEDB patterns, RCA nuances, all documented by us
- Every edge case, integration quirk, and failure pattern already catalogued in our KEDB

Day 1 FULL OPERATIONAL OWNERSHIP, NO RAMP

04 · LEADERSHIP COMMITMENT

C-Suite On The Line. Every P1.

- StatusNeo leadership 100% engaged, this is a direct escalation path, not a support ticket
- Fixed-fee, outcome-accountable model, and our incentive is to prevent incidents, not count them
- Proven track record of going beyond contract scope to protect IndiGo's digital revenue

Fixed Fee OUTCOME MODEL — NO PER-INCIDENT CHARGING

05 · AUTHENTIC AI™

AI That Compounds. Not AI Theatre.

- 5 Agentic AI agents — Early-Warning, Triage, Root-Cause, Remediation, Learning, will be live on Enterprise OS Fabric™
- Explainable AI with confidence scores, where IndiGo retains full authority, human override always available
- Learning Agent builds KEDB intelligence that compounds: 55%+ recurrence reduction by Year 3

55%+ INCIDENT RECURRENCE REDUCTION BY YEAR 3

06 · ZERO TRANSITION RISK

Expansion of Trust. Not a Partner Change.

- Every alternative partner needs 12–24 weeks of onboarding. StatusNeo needs zero.
- Already inside IndiGo's systems, governance structures, OCP approvals, and production access
- One partner across MS, Mobile, Web, OCP, Testing, Observability and now DRCC, no seams

Lowest TRANSITION RISK OF ANY PARTNER BY FAR

THANK YOU!

Every startup aims to scale like an enterprise. Every enterprise seeks the agility of a startup. We've helped startups grow and enterprises move faster— driving growth, agility, and innovation.

WE LOOK FORWARD TO PARTNERING WITH YOU.

StatusNeo

APPENDIX - SHIFT ROSTER

StatusNeo

Glance of DRCC, Who's available every hour

Every role carries a defined AI-augmented workflow. Minimum 3 engineers per shift at all times. On-call L3/P1 Technical Lead available within 15 minutes at any hour, 365 days a year.

APPENDIX - CASE STUDIES

CASE STUDY 1 - BAU INCIDENT TRIAGE & SLA RECOVERY FOR ENTERPRISE IT OPS - FINANCIAL SERVICES

StatusNeo

Problem Statement & Challenges

A diversified financial services organisation operated a large internal IT landscape spanning end-user computing, core business applications, identity services, collaboration tools, and enterprise middleware — supported by multiple vendors and internal teams. The result was chronic routing errors, ticket bouncing, unclear ownership, and governance compliance risk across all service-level tiers.

Relevance for IndiGo

Multi-Source Alert Correlation

Supply chain incident correlation directly mirrors IndiGo's multi-source ingestion model — correlating alerts from ServiceNow, Datadog, Firebase, ELK, and synthetic monitoring into unified actionable incidents.

Third-Party Dependency Management

Managing EDI/API failures across suppliers directly parallels IndiGo's GDS, PSS, and payment gateway dependency management — where StatusNeo owns vendor coordination and escalation to closure.

Business-Impact Prioritisation

Prioritising incidents by order value and shipping cut-off maps exactly to IndiGo's revenue-impact model — where performance degradation = P1 because booking conversion and NPS are at stake.

Automated Runbook Governance

Pre-approved automated playbooks with approval logic and audit logging directly demonstrate the Remediation Agent model StatusNeo proposes for IndiGo under Authentic AI™.

Frequent Routing Errors & Ticket Bouncing

Without intelligent assignment, tickets moved through 3–5 teams, causing delays and wasting time on hand-offs instead of actual investigation.

Unclear Ownership in Multi-Vendor Model

SLA ownership was often disputed among various vendors and internal teams in the ITSM environment, leading to delays in escalation and obscuring accountability in governance reviews.

No Systematic Problem Management

Recurring incidents were handled as standalone tickets rather than being promoted to problem records — resulting in the same root causes surfacing repeatedly without any structured CAPA or KEDB enrichment.

Incomplete Ticket Quality at Source

Under-specified tickets entered resolver queues w/o impacted application, business urgency, or reproducibility steps , forcing resolver teams to validate before they could investigate.

Aging Backlog Before Governance Reviews

Operations managers discovered aged backlog only when preparing for quarterly reviews — with no real-time mechanism to identify stalled tickets, likely duplicates, or vendor- dependent items requiring proactive chase.

Reactive SLA Management

SLA breaches were identified after they occurred, not before. Operations teams had no predictive signal about which tickets were trending toward breach, making intervention reactive rather than proactive.

How this would relate to IndiGo

40%+

MTTR reduction delivered in Production

45%+

Dupllicate Incident voice eliminated

SNOW + AI/ML

Governed in Production

CASE STUDY 1 - BAU INCIDENT TRIAGE & SLA RECOVERY FOR ENTERPRISE IT OPS - FINANCIAL SERVICES

StatusNeo

Business Benefits

35% Reduction in Misrouted Tickets

AI-driven resolver group prediction with confidence scoring eliminated mis-assignment across a multi-vendor environment, stopping ticket-bouncing before it consumed engineering capacity.

20% Increase in First-Time-Right Assignment

Historical assignment models leveraging CI, department, source, and alert patterns achieved significantly higher routing accuracy than the previous rules-only approach.

27% Reduction in Aged Backlog

Backlog workbench identified stalled tickets, likely duplicates, and vendor-dependent items, enabling operations managers to drive structured resolution before governance reviews.

15% Improvement in Overall SLA Attainment

SLA breach prediction model surfaced at-risk tickets before breach, allowing proactive reassignment and escalation rather than reactive breach management.

Improved Governance Visibility

Unified dashboard across multi-vendor operations gave leadership real-time accountability view, with incident ownership, SLA trajectory, and escalation status in a single pane.

Solution Summary

An enterprise-wide triage and SLA recovery framework built to automate incident qualification, assignment, aging-risk detection, and RCA recommendation across internal IT operations for a diversified financial services organisation. The program focused on improving service desk productivity, governance maturity, and cross-vendor accountability — without replacing existing ITSM tooling or disrupting ongoing operations.

Incident Qualification Assistant

AI models and guided intake forms prompted users and agents to capture impacted application, user geography, error context, business urgency, and recent changes — eliminating under-specified tickets before they entered resolver queues and caused routing delays.

SLA Breach Prediction and Backlog Workbench

A risk model predicted which tickets would breach SLA based on age, priority, reassignment count, queue state, and vendor dependency — feeding a daily action board. A backlog workbench identified stalled tickets, duplicates, and unresolved repeats suitable for promotion to problem records.

Resolver Group Predicton & Auto-Assignment

Historical assignment models used summary, affected CI, requester department, ticket source, and alert patterns to recommend resolver group with confidence score — enabling auto-assignment for high-confidence tickets and human review for borderline cases.

RCA Recommendation & Problem Creation

Repeat patterns were automatically flagged for problem management. RCA hypotheses surfaced from similar historical incidents, monitoring alerts, release and change history, and CMDB dependencies — accelerating investigation without removing engineer accountability for decision-making.

Benefits

35% Misrouted Ticket Reduction

20% First Time-Right Assignment Gain

27% Aged Backlog Reduction

15% Overall SLA Attainment Gain

√ Multi-Vendor Governance Unified

APPENDIX - CASE STUDIES

CASE STUDY 2 - ITSM AUTOMATION FOR MANUFACTURING SUPPLY CHAIN & WAREHOUSE SYSTEMS

StatusNeo

Problem Statement & Challenges

A global manufacturing enterprise running multiple plants and distribution centres experienced recurring incidents across ERP, warehouse management, transport planning, and supplier integration platforms. Incidents were often symptoms of the same underlying issue logged separately by different users across locations — creating duplicated effort, fragmented RCA and missed business SLAs for order processing and dispatch at scale.

Duplicate Incident Logging Across Locations

The same underlying failure was logged as 8–12 separate tickets by users in different warehouses, overwhelming L2 teams with noise and masking the actual root cause behind volume.

Fragmented RCA Without System Context

RCA was performed ticket-by-ticket without correlating deployment changes, middleware telemetry, or infrastructure events, resulting in surface-level fixes that recurred within days.

Failed EDI & API Transactions at Scale

Supplier EDI ingestion failures, inventory synchronisation gaps, and job failures affecting order fulfilment were manually identified, often only after business impact had already materialised.

Device Connectivity in Warehouse Zones

Handheld device failures across warehouse zones disrupted picking operations. Without correlation, each device failure was triaged independently rather than as a network-zone event.

No Systematic Problem Management

No prioritisation by order value or shipping cut-off meant low-impact tickets consumed capacity while high-value dispatch incidents waited in the same queue unaddressed.

No Visibility into Recurring Failure Modes

The same post-release configuration mismatches and middleware queue failures recurred every sprint cycle, but without pattern detection, each recurrence was treated as a new incident

Relevance for IndiGo

Multi-Source Alert Correlation

Supply chain incident correlation directly mirrors IndiGo's multi-source ingestion model — correlating alerts from ServiceNow, Datadog, Firebase, ELK, and synthetic monitoring into unified actionable incidents.

Third-Party Dependency Management

Managing EDI/API failures across suppliers directly parallels IndiGo's GDS, PSS, and payment gateway dependency management — where StatusNeo owns vendor coordination and escalation to closure.

Business-Impact Prioritisation

Prioritising incidents by order value and shipping cut-off maps exactly to IndiGo's revenue-impact model, where performance degradation = P1 because booking conversion and NPS are at stake.

Automated Runbook Governance

Pre-approved automated playbooks with approval logic and audit logging directly demonstrate the Remediation Agent model StatusNeo proposes for IndiGo under Authentic AI™.

Key Solution Design Decisions

Correlation Over Count

Team chose to solve for noise reduction before RCA, because accurate incident consolidation was the prerequisite to meaningful RCA work at this volume.

Service-Centric Model

Mapping incidents to business services (order-to-ship steps) rather than CI records allowed business stakeholders to consume impact reports in operational terms.

Governance First

Every automation included approval logic and complete audit logging, ensuring the solution could operate in a regulated multi-plant environment & in-compliance

Tech Stack

ServiceNow ITSM & CMDB | **SAP Integration Layer** | **Python** | **Azure ML / scikit-learn** | **Kafka / Middleware telemetry** | **Splunk log analytics** | **PowerBI Dashboards** | **API Orchestration**

CASE STUDY 2 - ITSM AUTOMATION FOR MANUFACTURING SUPPLY CHAIN & WAREHOUSE SYSTEMS

StatusNeo

Business Benefits

45% Reduction in Duplicate Incident Volume

AI-driven resolver group prediction with confidence scoring eliminated mis-assignment across a multi-vendor environment, stopping ticket-bouncing before it consumed engineering capacity.

20% Increase in First-Time-Right Assignment

Intelligent incident correlation grouped related tickets , multiple warehouse login failures, repeated EDI errors, and batch job failures — into single parent issues, eliminating duplicated L2/L3 effort

32% Faster RCA Identification

Predictive RCA engine surfaced likely root causes like, middleware queue failures, stale inventory cache, malformed supplier payloads , hence reducing time-to-diagnosis for recurring supply chain incidents.

25% Reduction in Order-Impacting SLA Misses

Business-impact-weighted prioritisation ensured order-fulfillment incidents were resolved before shipping cut-off deadlines, directly protecting dispatch SLAs.

22% Improvement in Warehouse System Availability

unbook automation restarted queue listeners, reprocessed failed EDI messages, and refreshed device credentials, hence resolving known failure modes in seconds rather than hours.

Solution Summary

An enterprise-wide triage and SLA recovery framework built to automate incident qualification, assignment, aging-risk detection, and RCA recommendation across internal IT operations for a diversified financial services organisation. The program focused on improving service desk productivity, governance maturity, and cross-vendor accountability — without replacing existing ITSM tooling or disrupting ongoing operations.

Incident Qualification Assistant

AI models and guided intake forms prompted users and agents to capture impacted application, user geography, error context, business urgency, and recent changes — eliminating under-specified tickets before they entered resolver queues and caused routing delays.

SLA Breach Prediction and Backlog Workbench

A risk model predicted which tickets would breach SLA based on age, priority, reassignment count, queue state, and vendor dependency — feeding a daily action board. A backlog workbench identified stalled tickets, duplicates, and unresolved repeats suitable for promotion to problem records.

Resolver Group Predicton & Auto-Assignment

Historical assignment models used summary, affected CI, requester department, ticket source, and alert patterns to recommend resolver group with confidence score — enabling auto-assignment for high-confidence tickets and human review for borderline cases.

RCA Recommendation & Problem Creation

Repeat patterns were automatically flagged for problem management. RCA hypotheses surfaced from similar historical incidents, monitoring alerts, release and change history, and CMDB dependencies — accelerating investigation without removing engineer accountability for decision-making.

Benefits

45% Duplicate Incident Volume reduction

32% Faster RCA identification

25% Order SLA Miss Reduction

22% Warehouse System Availability gain

↓ ↓ Ticket Backlog at Peak periods

APPENDIX - CASE STUDIES

CASE STUDY 3 - AI/ML-DRIVEN INCIDENT CLASSIFICATION & RCA PREDICTION — HEALTHCARE TECHNOLOGY SUPPORT

StatusNeo

Problem Statement & Challenges

A healthcare technology provider supporting hospital and clinic systems handled a high volume of production support incidents across patient administration, billing, scheduling, lab integration, and clinician access platforms. The support team relied entirely on SME knowledge to interpret incidents and identify probable causes, creating critical scale limitations during peak periods and off-hours when senior engineers were unavailable. Any delay had immediate operational and patient-care consequences.

Relevance for IndiGo

Direct AI/ML Capability Proof

Healthcare ITSM demands the same explainability, auditability, and Human-in-the-Loop governance that StatusNeo will operate at IndiGo — with every AI recommendation subject to engineer validation and model confidence scoring per Authentic AI™.

SME Knowledge at Scale

IndiGo's RCA gap / SME dependency at off-hours is identical to the healthcare challenge. This deployment proves StatusNeo's ability to institutionalise expert knowledge into a continuously learning AI model

Regulated Environment Track Record

Operating under healthcare compliance constraints, i.e. model version control, fallback to manual, prediction traceability, demonstrates the same discipline IndiGo's security and governance requirements demand.

Continuous Learning Architecture

The feedback loop, where analyst accept/reject decisions retrain the model, is the foundation of StatusNeo's Learning Agent, targeting ≥55% repeat incident reduction at IndiGo by Year 3.

SME Knowledge Bottleneck

Senior engineers were the only people who could reliably identify root causes — creating single points of failure across shifts and an impossible scaling challenge during peak demand.

No Explainability in Regulated Ops

Healthcare operations required every support decision to be traceable and auditable. Black-box automation was not acceptable — every AI recommendation needed confidence scoring and override capability.

Off-Hours Support Gap

Night shift and weekend support teams lacked access to institutional knowledge — resulting in longer MTTR for repeat issues and higher escalation rates when senior SMEs were not available.

Inconsistent Categorisation

Free-text ticket descriptions led to inconsistent categorisation across agents — wrong resolver assignments, delayed diagnosis, and repeat escalations for issues that had known resolution patterns.

Repeat Issues Without Pattern Detection

The same interface failures, auth issues, and database contention events recurred without detection — because there was no mechanism to identify patterns from historical incident closure data.

Scale Limitations at Peak Load

Incident volume during peak periods exceeded the capacity of experienced engineers — creating SLA backlog that persisted into subsequent shifts and compounded across the support week.

AI/ML Model Pipeline — How It Worked

01	02	03	04	05	06
Data Ingestion	Classification	RCA Prediction	Recommendation	Human decision	Feedback loop
18 months of incidents, logs, change records, KEDB normalised	Category · Domain · Urgency · Resolver team predicted	Probable cause family surfaced with confidence score	Category · Domain · Urgency · Resolver team predicted	Analyst accepts / rejects / modifies with full override authority	Actions retrain model, precision improves with every cycle

Tech Stack

Python **PyTorch / Hugging Face Transformers** **scikit-learn** **ML Flow** **Azure ML** **ServiceNow** **Databricks** **PowerBI**

CASE STUDY 3 - AI/ML-DRIVEN INCIDENT CLASSIFICATION & RCA PREDICTION — HEALTHCARE TECHNOLOGY SUPPORT

StatusNeo

Business Benefits

50% Faster Incident Categorisation

Multi-class ML pipeline classified incidents by category, domain, urgency band, and resolver team, eliminating manual categorisation delays across all shifts including off-hours.

30% Faster RCA Hypothesis Generation

RCA prediction model surfaced probable cause families within seconds of ticket creation, accelerating engineer investigation without removing clinical judgment from the loop.

22% Reduction in Escalation Effort

Resolution recommendation engine surfaced relevant knowledge articles, prior similar tickets, and runbook steps — resolving known patterns before escalation was triggered.

18% Reduction in MTTR for Repeat Issues

Human-in-the-loop feedback loop continuously improved model precision, so repeat production issues were resolved faster as the model learned from analyst accept/reject decisions.

Consistent Decisions Across All Shifts

SME knowledge was institutionalised in the model, eliminating the performance gap between peak-hours senior engineers and off-hours junior support across all hospital and clinic systems.

Solution Summary

An AI/ML framework designed to classify incidents, predict root-cause categories, and recommend remediation paths for production support teams, purpose-built for a regulated healthcare environment. Every model decision was explainable, auditable, and subject to analyst override, with continuous improvement driven by human-in-the-loop feedback. The design prioritised production readiness over model complexity.

Data Foundation & Training

18 months of historical incidents, problem records, application logs, change records, and known error catalogues normalised — resolving inconsistent categories, free-text descriptions, outdated resolver mappings, and duplicate RCA labels — to build a clean training corpus.

Multi-Class Incident Classification

Classification pipeline predicted incident category, application domain, urgency band, likely impacted service, and resolver team using structured and unstructured features — including text embeddings from incident summaries and clinical system notes.

RCA Prediction & Resolution Engine

RCA model identified probable cause families: interface failure, access/auth issue, infrastructure bottleneck, release/config defect, database contention, or external dependency failure. Resolution engine recommended knowledge articles, prior tickets, and specific log sources to inspect.

Governance, Explainability & Human Loop

Regulated environment required: model version control, confidence thresholds, fallback to manual review, prediction traceability, and audit logs. Analysts accepted, rejected, or modified every recommendation — feeding actions back into the model training pipeline continuously.

Benefits

50% Faster issue categorisation

30% Faster RCA hypothesis

22% Escalation effort reduction

18% MTTR reduction for repeate issues

√ Consistent decisions across all shifts

APPENDIX - CASE STUDIES

CASE STUDY 4 - AIOPS PLATFORM INTEGRATION FOR PROACTIVE INCIDENT PREVENTION — TELECOM ENTERPRISE

StatusNeo

Problem Statement & Challenges

A telecom enterprise managing customer-facing digital channels and network support systems had multiple monitoring and operations tools — but no cohesive AIOps operating model. Different teams used separate observability and incident workflows, resulting in fragmented incident response, poor event prioritisation, low automation confidence, and reactive-only operations. The organisation needed to ingest signals from several platforms, correlate business-impacting events, and enable proactive incident prevention at enterprise scale.

Relevance for IndiGo

Direct AIOps Requirement Match

IndiGo's RFP explicitly requires AIOps platform integration — DataDog, BigPanda, Moogsoft, ServiceNow AIOps style integration model. This deployment proves production-grade capability across all specified platform types

60% Alert Noise Reduction Target

StatusNeo's commitment to 60% alert noise reduction at IndiGo's DRCC is directly grounded in this deployment, where 45% false-positive reduction was achieved through dynamic baselines and intelligent event suppression in a comparable high-volume environment.

Early-Warning Agent Architecture

The multi-tool signal aggregation and dynamic anomaly detection model is the direct foundation of StatusNeo's Early-Warning Agent deployed for IndiGo, providing the 6-hour predictive incident probability scoring capability committed in the proposal.

Proactive Prevention — Not Reactive Response

30% incident volume reduction through proactive suppression directly validates StatusNeo's shift from reactive to predictive operations, the core of IndiGo's Business Driver #4 and the Year 3 predict phase commitment.

Fragmented Multi-Tool Observability

APM, infrastructure monitoring, network alerts, and service desk each operated in isolation, and no correlation across tool boundaries meant critical multi-system events were missed until customer impact occurred.

Poor Event Prioritisation

Without business-impact weighting, technically active alerts competed equally regardless of customer-facing consequence, causing critical revenue-impacting events to sit in the same queue as minor infrastructure noise.

No Cross-Team Operational Alignment

NOC, application support, and service management operated with separate processes, different tool views, and no shared incident picture, creating hand-off delays and repeated context loss during escalation.

Static Thresholds Creating Alert Floods

Static alert rules generated massive volumes of false-positive events, overwhelming NOC teams with noise and eroding confidence in automated alerting to the point where teams started ignoring system-generated alerts.

Reactive-Only Incident Response

The absence of anomaly detection and predictive signalling meant every incident was discovered after customer impact had materialised, no proactive prevention capability existed despite multiple monitoring tools being deployed.

Low Confidence in Automation

Previous automation attempts had generated incorrect actions due to poor event quality, creating risk aversion that left valuable automated remediation capabilities unused across the operations team.

AIOps Signal Flow - End-to-End architecture

01 Signal Aggregation
APM · Infra · Network · ServiceDesk into central AIOps layer

02 Dynamic Baseline
Statistical anomaly detection on latency, errors, restarts, resources

03 Event Suppression
False positives filtered; correlated events grouped into incidents

04 Business weighting
Impact · Geography · Transaction volume · Dependency depth scored

05 RCA prediction
Root-cause zone recommended · Network · Config · DB · Middleware

06 Feedback loop
Runbooks + first-response automation for validated patterns

AIOps Integration Layer **DataDog / BigPanda / Moogsoft** **ServiceNow AIOps** **Python** **Anamoly detection algos** **Event correlation engine** **CMDB & Service topology** **NOC / SRE dashboards**

CASE STUDY 4 - AIOPS PLATFORM INTEGRATION FOR PROACTIVE INCIDENT PREVENTION — TELECOM ENTERPRISE

StatusNeo

Business Benefits

45% Reduction in False-Positive Alerts

Dynamic baselines and event suppression eliminated noise from monitoring tools, support teams focused only on material, business-impacting events rather than technically active but operationally irrelevant alerts.

30% Reduction in Incident Volume

Proactive suppression and event correlation reduced the total incident volume reaching the operations team, preventing incidents rather than managing them after customer impact had already occurred.

20% Improvement in Service Availability

Priority digital services achieved measurable availability improvement through guided remediation and first-response automation, resolving common failure patterns before engineer intervention was required

Faster Triage & Decision Confidence

Probable cause prediction and business-impact prioritisation gave operations teams a structured, evidence-based starting point, eliminating guesswork and reducing mean-time-to-diagnose across all incident types.

Monitoring, ITSM & Engineering Aligned

A single AIOps operational picture unified NOC, application support, and service management teams, replacing fragmented tool-by-tool workflows with a cohesive, cross-functional incident response model.

Solution Summary

An integrated AIOps framework connecting monitoring, service management, and automation layers across a fragmented multi-tool landscape. The solution focused on multi-source signal aggregation, dynamic anomaly detection, business-impact-weighted prioritisation, probable cause prediction, guided remediation, and continual model learning — transforming reactive incident management into proactive incident prevention for customer-facing digital channels and network support systems.

Multi-Tool Signal Aggregation

Signals from APM, infrastructure monitoring, network alerts, and service desk records aggregated into a central AIOps layer, creating a single common operational picture across all support functions and eliminating siloed tool-by-tool workflows.

Dynamic Baselines & Anomaly Detection

Dynamic baselines replaced static thresholds, detecting unusual behaviour in transaction latency, API error rates, service restart frequency, resource usage, and dependency failures. Anomalies surfaced only when behaviour was statistically significant relative to historical norms.

Business-Impact Prioritisation & RCA

Events weighted by customer-facing service impact, geography, transaction volume, dependency depth, and prior instability history. Probable cause model recommended root-cause zones, application layer, network path, config changes, middleware saturation, or database degradation.

Guided Remediation & Continual Learning

Remediation suggestions and linked runbooks pushed directly into incident workflows. For selected patterns, automation executed first-response actions before engineer intervention. Model improved from closure notes, accepted/rejected recommendations, and change failure outcomes.

Benefits

45%
False Positive Alert reduction

30%
Incident volume reduction

20%
Service availability improvement

APPENDIX - CASE STUDIES

CASE STUDY 5 - END-TO-END DIGITAL COMMAND CENTRE FOR ENTERPRISE DIGITAL BANKING

StatusNeo

Problem Statement & Challenges

A digital-first bank operating entirely on mobile and API channels required a unified operational model to manage incidents across onboarding journeys, payments, authentication, integrations, and cloud infrastructure. The platform relied on multiple engineering squads and technology partners supporting microservices, identity systems, payment rails, and customer experience layers. As customer volumes increased, operational complexity resulted in delayed triage decisions, fragmented observability, and reactive SLA management. A centralised command centre was required to improve incident prioritisation, reduce routing delays, and create consistent governance across business-critical digital journeys.

Relevance for IndiGo

MULTI-SOURCE ALERT CORRELATION
Transaction journey correlation across logs, metrics, API performance, and UX signals directly mirrors IndiGo's multi-source ingestion model spanning booking, payment, mobile check-in, and partner integrations.

THIRD-PARTY DEPENDENCY MANAGEMENT
Identity verification, payment networks, and credit scoring providers introduced dependency patterns comparable to IndiGo's reliance on GDS, payment gateways, and airport systems.

BUSINESS-IMPACT PRIORITISATION
Prioritising incidents by login success, payment completion, and onboarding conversion maps directly to IndiGo's revenue-impact model where booking conversion and check-in reliability are P1 concerns.

RUNBOOK-DRIVEN INCIDENT GOVERNANCE
Pre-defined response playbooks for API latency spikes, session failures, and payment retries directly mirror the Remediation Agent and KEDB governance model proposed for IndiGo's DRCC.

FREQUENT ROUTING DELAYS IN DEFECT TRIAGE
- Incidents required manual interpretation before assigning to the correct resolver group, increasing time to investigation and consuming engineering capacity in unnecessary hand-offs.

UNCLEAR OWNERSHIP ACROSS VENDORS
- Cloud providers, integration partners, and internal teams shared operational responsibilities, creating escalation ambiguity and obscuring accountability in governance reviews.

FRAGMENTED OBSERVABILITY ACROSS LAYERS
- Separate dashboards for infrastructure, APIs, and applications reduced ability to identify correlated incidents and increased mean time to detect cross-layer failures.

AGING BACKLOG BEFORE GOVERNANCE REVIEWS
- Duplicate incidents and stalled tickets were identified late in the lifecycle due to lack of continuous triage insights and real-time backlog monitoring.

REACTIVE SLA RISK IDENTIFICATION
- Operations teams lacked early indicators of incidents trending toward SLA breach, making intervention reactive rather than proactive and resulting in avoidable SLA failures.

MULTI-SOURCE ALERT FRAGMENTATION
- Transaction journeys required correlation across logs, infrastructure metrics, API performance, and user experience signals without a unified ingestion model — mirroring airline flows across booking, payment, check-in, and partner integrations.

Relevance For Indigo Command Centre

01

DIRECT DIGITAL COMMAND CENTRE MATCH

IndiGo's DRCC requirement for unified command across mobile, API, booking, and payment journeys is directly evidenced by this deployment, proving operational readiness across comparable digital-first architectures.

02

AI-ASSISTED TRIAGE WITHOUT GOVERNANCE RISK

The selective AI augmentation model - enriching context and recommending resolver groups without replacing human judgment — mirrors StatusNeo's Authentic AI™ governance approach for IndiGo's incident workflows.

03

MULTI-VENDOR ACCOUNTABILITY FRAMEWORK

Unified vendor governance across cloud, integration partners, and internal teams directly supports IndiGo's requirement for accountability across GDS, PSS, payment gateways, and airport system dependencies.

ServiceNow ITSM & CMDB | Application Performance Monitoring | Cloud Platform Monitoring | SQL Data Mart | Power BI Dashboards | API Gateway Logs | Synthetic Monitoring Tools | Lightweight ML Models for incident classification and pattern recognition

CASE STUDY 5 - END-TO-END DIGITAL COMMAND CENTRE FOR ENTERPRISE DIGITAL BANKING

StatusNeo

Business Benefits

30% REDUCTION IN MISROUTED INCIDENTS

Triage patterns improved routing accuracy across application, API, and infrastructure teams — stopping mis-assignment before it consumed engineering capacity in unnecessary hand-offs.

IMPROVED GOVERNANCE VISIBILITY

Single operational view improved leadership oversight across vendors and internal teams, with incident ownership, SLA trajectory, and escalation status unified in a single pane of glass.

15% IMPROVEMENT IN OVERALL SLA ATTAINMENT

Early signals helped teams intervene before breach thresholds, converting reactive breach management into proactive SLA governance across all digital journey tiers.

20% IMPROVEMENT IN FIRST-TIME-RIGHT RESOLUTION

Better classification of impacted components and context-enriched ticket creation reduced rework cycles and eliminated resolver round-trips caused by incomplete incident information.

Solution Summary

A structured command centre framework implemented standardised triage, SLA monitoring, dependency mapping, and problem management practices across digital banking systems. Selective use of AI-assisted triage supported faster interpretation of incident context without changing governance structure. The program focused on improving routing accuracy, backlog health, and multi-vendor accountability — without replacing existing ITSM tooling or disrupting ongoing operations.

INTELLIGENT INCIDENT CATEGORISATION

Historical incident patterns were used to recommend probable resolver groups based on error metadata, impacted application layer, and dependency signals — improving routing accuracy across application, API, and infrastructure teams.

CONTEXT ENRICHMENT AT TICKET CREATION

Incident records were automatically enriched with environment context, affected journey, probable component, and similar past incident references — eliminating under-specified tickets before they entered resolver queues.

DUPLICATE INCIDENT DETECTION

Pattern matching identified incidents with similar error signatures, reducing duplicate investigation effort and consolidating resolution across recurring failure patterns into structured problem records.

SLA RISK IDENTIFICATION & PROBLEM MANAGEMENT

Operational dashboards highlighted incidents trending toward SLA breach based on priority, age, and dependency risk indicators. Recurring incidents consolidated into a knowledge library to reduce repeat occurrence and accelerate resolution.

Benefits

30% MISROUTED INCIDENT REDUCTION

20% FIRST-TIME-RIGHT RESOLUTION GAIN

26% AGED BACKLOG REDUCTION

√ UNIFIED JOURNEY VISIBILITY

√ MULTI-VENDOR GOVERNANCE UNIFIED

15% OVERALL SLA ATTAINMENT GAIN

40%+ POTENTIAL MTTR IMPROVEMENT

30%+ DUPLICATE INCIDENT EFFORT REDUCTION
