II. Critical Capabilities & High-Level Scope of Work

2.1 Cart Abandonment Detection and Recovery

The system should enable identification of exit intent and high-intent customers abandoning the booking journey, particularly during: • Passenger Details stage • Payment stage • Differentiation between browse abandonment and high-intent abandonment • Support for recovery beyond nudges (e.g., live assistance, escalation routing) and target engagement

Fully Complies

Qualtrics supports exit-intent and abandonment detection through digital intercepts, including site abandonment and cart abandonment, which can be triggered when a visitor shows intent to leave (for example, via a mouse-out behavior) without blocking them from exiting.

For higher-intent abandonment scenarios, Qualtrics supports cart abandonment and post-transaction intercept patterns, and can also run targeted intercepts based on behavioral signals such as time-on-site, pages visited, and specific actions to engage visitors at the most relevant point in their journey.

Qualtrics supports recovery beyond nudges by enabling targeted engagement and closed-loop workflows, including proactive in-journey interventions (for example, embedding instructional videos or direct links when users struggle) and operational follow-up via native closed-loop ticketing/case management with automated ticket routing, assignments, escalations, group queues, and response facilitation.

The solution must support triggering contextual engagement prompts or nudges aimed at improving completion rates.

Fully Complies

Qualtrics Website & App Feedback can present targeted on-site or in-app messages and feedback opportunities based on criteria such as user info, browser session, website data, date/time, web services, and user actions, using intercept types like sliders, feedback links, info bars, and popovers; triggering logic can also use conditions tied to browsing session, in-page HTML, JavaScript, and analytics variables. Qualtrics can also improve completion by presenting a progress completion bar and tailoring survey look and feel to a gamified format.

2.2 Real-Time Journey Intervention & Recovery

Contextual, real-time interception of users exhibiting high-friction signals

Fully Complies

Qualtrics can intercept and engage website or app visitors in-session using targeted intercepts whose display is triggered only when predefined criteria are met, based on monitored user interactions after deploying a Qualtrics-generated JavaScript snippet in your site header.

Those criteria can be contextual and behavior-driven, including Qualtrics Digital Frustration Signal Detected, which lets you trigger experiences based on frustration behaviors such as rage clicks,

error clicks, dead clicks, and mouse thrashes so you can understand and improve the UX/UI on desktop, mobile web, and mobile app.

When Session Replay is enabled, Qualtrics tracks four frustration behaviors across your site, with specific thresholds for rage click, mouse thrash, error click, and dead click, and you can review the resulting frustration signals in the Session Replay tab with video evidence of user actions.

Recognition of returning users who previously abandoned or failed journeys and proactive re-engagement

Partially Complies

Qualtrics recognises and analyses failed or abandoned digital journeys by capturing real-time behavioural signals and using advanced digital analytics, session replay, and behavioural heuristics to pinpoint broken journeys and drop-off points, then connecting behaviour with outcomes like CSAT to estimate business impact and prioritise next steps.

For proactive re-engagement, Qualtrics supports targeted, in-journey web and mobile intercepts triggered by specific behaviours (for example, time on page or navigation patterns) to capture feedback when it is most relevant and turn that touchpoint into a helpful intervention, including embedding instructional videos or direct links when users are struggling.

Qualtrics also enables segmentation and profile-based action: it can integrate behavioural, experiential, and operational data into the Qualtrics directory to build rich interaction profiles and create segments to understand journeys at scale, and Experience iD creates unified profiles from signals across channels so teams can construct dynamic segments for targeted outreach and orchestrate journeys to improve experience at critical touchpoints.

In practice, this can extend to proactive outreach programs based on predictive modelling; for example, ServiceNow blended operational and experiential data in Qualtrics to identify at-risk hallmarks among non-responders and launched proactive outreach to engage those accounts before churn.

Qualtrics also supports journey research patterns commonly used to address abandonment, including abandonment studies, site exit surveys, and overall site experience research, and recommends combining persistent opt-in feedback with behavioural context (and, where applicable, session replay) to better understand and act on friction points.

2.3 Journey-Level Feedback Collection

The solution must enable feedback capture across the complete digital journeys including: • Flight Search Page • Passenger Details • Add-ons selection • Payment Page • Booking Confirmation • Web Check-in funnel

Partially Complies

Qualtrics Frontline Digital supports capturing digital feedback across website and in-app experiences using capabilities such as page-level feedback, abandonment surveys, overall site experience research, and post-transaction surveys to help break down barriers to conversion and act on insights.

It also supports targeted intercepts across your website or app, triggered by specific behaviors like time spent on a page or navigation patterns, and you can use advanced website, mobile, and in-app targeting using over 20 behavioral variables such as geolocation and device type.

Implementation typically includes coordinating to add Website or App Feedback code to the website, building and training teams on creatives and intercept rules, building and reviewing the survey, testing on a QA or beta site, and launching with a best-practice review by the Qualtrics implementation team.

Feedback collection should support both structured surveys and open-text feedback capture. The solution should also be capable of Calculating and tracking CSAT scores consistently.

Fully Complies

Qualtrics supports structured, quantitative and qualitative surveys using scaled items and open-ended free text questions, and it can also capture feedback through post-call surveys that include multiple choice and open-text questions. Open-text feedback is automatically analysed using Qualtrics native text analysis tool, Text iQ, to discover patterns and trends; discovered topics are integrated into reporting so they can be classified, filtered, analysed, and shared.

Qualtrics supports calculating and tracking CSAT through flexible CSAT templates at specific touchpoints and dashboards that help publish, trend, and break down CSAT results by relevant dimensions (for example customer tier, product type, touchpoints, and customer longevity). Following implementation, Qualtrics also sends a CSAT survey to all customers and reports an overall post-implementation CSAT percentage of 95% across product lines, with a technical support CSAT rate of 97%.

2.4 AI-Based Feedback and Insights Analysis

The platform must support AI-powered text analytics to process open-ended customer feedback. Capabilities should include, but not limited to: • Drop-Off Trend Analysis • Topic clustering • Sentiment detection • Issue categorization such as - • Predictive identification of abandonment or failure risk in-session • Behavioral + feedback signal fusion (not text alone) • Automated surfacing of top revenue-impacting friction drivers • Payment errors • UI/UX difficulties • Performance issues • Booking process confusion

Partially Complies

Qualtrics supports AI-powered text analytics for open-ended feedback, including automated topic identification and management, intent detection, and sentiment detection enriched with effort, emotion, actionability, and emotional intensity to speed analysis and help teams prioritize what to fix first.

It supports topic clustering and segmentation via cluster analysis in Stats iQ, including hierarchical clustering to determine an optimal number of clusters, with clusters saved as a new data field for use in crosstabs and dashboards, and it can track trends over time (including sentiment) across groupings and tags with customizable visualizations.

Qualtrics supports drop-off and friction analysis across digital journeys using advanced digital analytics, session replay, and behavioral heuristics like rage clicks and mouse thrashing, and it can fuse behavioral, experiential, and operational data, including integrating behavioral and operational data such as Google and Adobe Analytics variables and connecting user behavior with CSAT to estimate business impact.

Qualtrics provides driver and root-cause analysis to quantify how topics impact key business metrics (including customer loyalty and likelihood to return) and can illustrate potential revenue impact, helping teams surface and prioritize the highest-impact friction drivers and improvements over time.

2.5 Experience Monitoring Dashboards

The solution should provide centralized configurable dashboards enabling monitoring of: • Customer feedback trends • Journey-level drop-off rates • Behavioral friction indicators • Customer sentiment analysis Dashboards should be accessible to internal stakeholders, support exportable reports and enable trend analysis across journeys and digital channels

Partially Complies

Qualtrics provides centralized, highly configurable CX dashboards and reporting that let teams highlight key findings, take action on insights, collaborate, and report to stakeholders, with dashboards tailored to different roles and individuals and filtering to drill into specific populations or segments. These dashboards support customer feedback trend monitoring across topics and KPIs, multi-sourced views (including bringing customer and employee data into a single view), and journey-oriented analysis across multiple listening points to identify opportunities and friction in the experience.

For monitoring and analytics, Qualtrics supports real-time dashboards and reports, including automated survey performance summaries with response rates, completion, drop out rates, bounce backs, sent stats, and IP address of completions, with division/business unit breakdown and role-based access. Sentiment analysis is available via Text iQ, including sentiment labeling (very positive, positive, neutral, negative, very negative), topic extraction, and sentiment drivers analysis; Qualtrics can also combine structured and unstructured data and apply text analytics to build insights and visualizations. Dashboards and reports can be distributed to licensed users, scheduled on any cadence with notifications, and shared as exportable outputs such as PDF (including automatic distribution to users without access) and exports to PDF, JPG, PNG, or CSV; paginated reports can also be exported to PDF or shared via a public report link with a password-protected option.

2.6 Integration with Existing Digital Platforms

The implementation partner will be responsible for integrating the DX platform with existing digital systems including the Indigo Web and Mobile platforms. The integration must support secure and scalable data exchange.

Fully Complies

The Qualtrics platform is architected for secure, high-scale digital deployments through lightweight Web Intercept JavaScript tags and robust, native iOS and Android Mobile SDKs designed specifically to minimize application footprint and eliminate latency. The implementation partner will provide a code snippet with the Mobile & Website Intercept, which can easily embed these components into IndiGo's digital systems to capture behavioral signals and trigger real-time contextual interactions. Scalable data exchange is achieved via standard API extensions and real-time Webhooks that transport secure JSON payloads, fully supported by data encryption both in transit and at rest.

III. Functional Detailed Requirements

3.1 Feedback Capture • Deploy feedback widgets across key digital touchpoints. • Enable contextual surveys triggered based on user interaction events. • Support both structured questionnaires and open-text feedback collection. • Allow configurable survey triggers based on journey stage. • Calculate and track customer satisfaction score with respect to the user journeys on Indigo's Digital platforms, termed as Digital CSAT

Fully Complies

Qualtrics Website & App Feedback deploys targeted intercepts and engaging messages (for example sliders, feedback links, info bars, and popovers) directly on websites and mobile apps, supporting use cases such as cart abandonment and lead generation to help improve experiences and increase conversion rates.

Qualtrics supports contextual surveys triggered by user interaction and session context, using targeting logic with 20+ variables (including behavioral, location, and device-type variables such as geo-location and Adobe Analytics variables) plus embedded data captured from the visitor's session, device, or app usage.

Qualtrics supports structured questionnaires and open-text feedback, including quantitative and qualitative surveys with scaled items and open-ended free text questions.

Qualtrics supports configurable triggers aligned to the journey stage, including rules for when a survey is triggered and sent (for example post-purchase) across channels, and it can also initiate invitations from events outside Qualtrics via an endpoint call.

Qualtrics supports CSAT measurement and can connect user behavior with CSAT to estimate business impact and prioritise next steps, including breaking CSAT down by touchpoint and journeys so Digital CSAT can be tracked against user journeys on digital properties.

3.2 Behavioral Monitoring • Monitor user interactions across booking and check-in flows. • Capture behavioral signals such as rage clicks, dead clicks, repeated field corrections, and session inactivity. • Provide event-level behavioral analytics for troubleshooting digital experience issues.

Partially Complies

Qualtrics Digital Experience Analytics (DXA) monitors digital customer behavior with real-time feedback and session replays, and supports sophisticated targeting at key customer interaction points to help uncover the drivers behind user drop-offs and lower conversion rates.

When session replay is enabled, Qualtrics tracks frustration signals to pinpoint user friction and support troubleshooting of digital experience issues:

- Rage Click tracked as at least 4 consecutive clicks with less than 200 pixels and 300 milliseconds between each click
- Dead Click tracked as a click on a web button or hyperlink that should have produced an action and does nothing
- Mouse Thrash and Error Click are also tracked, and signals can be reviewed in the Session Replay tab as video evidence of user actions on mobile web and desktop

Qualtrics also supports event-focused investigation through session replay playback and AI-powered summaries for individual sessions that highlight what events occurred without requiring

full replay review, alongside dashboards that visualise session data and frustration trends over time and enable pattern/anomaly mining by behaviour.

3.3 Journey Analytics • Provide funnel analytics for digital journeys. • Identify the points in user journey where drop-offs happen, that is, users do not move to the next step in the journey. • Provide session-level journey reconstruction capabilities.

Fully Complies

- Qualtrics Digital Experience Analytics (DXA) provides funnel analytics that surface drop-off points along specified digital conversion funnels, helping you identify underperforming paths in digital journeys.
- Qualtrics also reports on where users fall out through metrics such as click-through rates, and provides a survey health report including dropout rates and completion percentages to show where respondents are falling off in the funnel.
- Qualtrics provides session-level journey reconstruction via session replay, which reconstructs how a user experiences your website and supports viewing, searching, filtering, and deleting recorded sessions from the session replay table within the platform.

3.4 Session Replay & Behavioral Reconstruction • Ability to replay individual user sessions across digital journeys • Masking of PII and sensitive fields • Direct, contextual linkage between individual customer feedback responses and their corresponding digital session replays. • Ability to export session evidence for engineering and support teams

Partially Complies

Qualtrics can replay individual user sessions across digital journeys using Session Replay, which reconstructs a user's experience by capturing behaviors such as mouse movements and page visits, and lets teams watch replays of individual sessions in the Sessions/session replay tab.

Qualtrics supports searching, filtering, and deleting recorded sessions from the session replay table, with detailed session fields including a replay link, frustration behavior counts, and whether a survey response occurred during the session.

For privacy, Session Replay is PII and GDPR compliant with masking and consent management capabilities. In DXA, Qualtrics encrypts session replay data in motion (before sending to Qualtrics servers) and at rest (before storage on Qualtrics servers).

PII controls include default masking of input form fields, optional masking modes (mask all content, choose what to mask, or no masking except password fields), non-retroactive masking rules, and the ability to delete sessions to remove already-captured sensitive data. By default, Qualtrics will not capture IP addresses for session replay unless explicitly added in visitor details, and user consent is enabled by default so sessions record only when an API call starts session replay under the opt-in setting.

Qualtrics links feedback context to sessions by enabling segmentation based on survey selections (including triggering events in integrated session replay vendors), by reflecting recorded sessions in XM Directory contact profiles for contact-level visibility, and by allowing filtering of recorded sessions by survey questions or sentiment in Digital Assist.

Qualtrics supports connecting user behavior with CSAT to estimate business impact and prioritize next steps, and it can pair Digital VoC feedback with DXA to identify problem areas and root causes using visual evidence from digital behavior.

For sharing evidence with engineering and support teams, Qualtrics supports exporting dashboards as PDFs and exporting underlying categorization and sentiment results in spreadsheet formats, along with flat-file exports and data exchange via a two-way real-time API. Qualtrics also supports automated exports via REST API pushes or SFTP flat file exports, plus manual raw-data exports in formats including CSV, XML, and SPSS.

IV. Non-Functional Detailed Requirements

4.1 Performance • The feedback widgets and behavioral monitoring components must not introduce noticeable latency within the booking flow. • Platform must support high concurrent user traffic typical of airline booking platforms.

Fully Complies

Qualtrics is designed and built as a high-performance, highly scalable solution, using a microservices-based, highly modular and redundant architecture that supports scaling individual layers based on demand and performing upgrades and maintenance without service disruption to users. Qualtrics also builds ahead with excess capacity in each data center to accommodate projected growth, spikes, demand, and data center failovers, and uses a content delivery network (CDN) and multiple data centers around the globe to support availability and performance. The environment is monitored 24/7 for reliability and performance using automated and manual processes, with customer-impacting incidents tracked in an online ticketing system and handled via coordinated service-team response and root-cause analysis. While Qualtrics is confident in its performance, specific performance levels cannot be guaranteed because external factors can impact performance.

Qualtrics can support concurrent use of the platform, and in some customer environments hundreds or thousands of users may access the platform simultaneously. There is no limit to concurrent users within Qualtrics. Access to the analytics suite is role-based (admin users, power users, and business users), and the platform cannot be accessed by more users than those who are licensed; licenses and usage are monitored regularly by the assigned Services team member from Qualtrics and reported as needed to IndiGo.

4.2 Scalability • The platform should scale to support: • High traffic volumes across all digital platforms

Fully Complies

Qualtrics is designed for scale to support high traffic volumes, using a highly modular, redundant architecture where individual layers can be scaled based on demand, and where upgrades and maintenance can be performed without service disruption to users. It operates nine global data centers built for 24/7/365 availability with redundancy within and across data centers, and it provisions excess capacity to accommodate growth, spikes, and failovers.

For high-volume survey delivery and response collection, Qualtrics decouples survey taking from the backend data store so surveys can be taken in any data center globally, including if an entire data center is taken offline, and it uses a separate production-grade environment to aggressively load and performance test these most demanding components. Qualtrics also supports large-scale analytics, including customers with hundreds of millions of feedback records, high-performance query and analytics, horizontally scalable database and application servers, and modern big data technologies that enable vertical and horizontal scaling to meet current and future capture and analytics requirements. There is no limit to concurrent users within Qualtrics.

4.3 Security & Data Protection The solution must comply with applicable regulatory and internal security standards including: • Digital Personal Data Protection Act • GDPR compliance where applicable • Secure handling of customer data • Data encryption in transit and at rest

Fully Complies

Qualtrics will comply with applicable Data Protection Law to the extent that such law imposes obligations directly upon Qualtrics as a Processor in connection with the Cloud Service specified in the Order Form. Qualtrics is GDPR certified and compliant as of May 25, 2018, and has incorporated GDPR requirements within its policies, procedures, and processing activities, with platform functionality to enable customers (as data controllers) to operate in a manner aligned with their privacy obligations.

Customer data is treated as confidential, and customers own and control the data while Qualtrics acts as the data processor; Qualtrics also provides self-service tools to support customers in fulfilling data subject requests. Data centers are subject to the laws in which the data center resides.

For third parties, Qualtrics has entered into a data processing agreement with all subprocessors, with obligations no less protective than the customer DPA, and its Legal and Security team ensures information security requirements are captured in supplier service level agreements; subprocessors must sign the Qualtrics Data Processing Addendum. For Restricted Transfers under GDPR Chapter V, Qualtrics relies on Standard Contractual Clauses as the transfer mechanism pursuant to Article 46, and integrates them into relevant subprocessor agreements.

Encryption in transit and at rest is supported, including AES 256-bit disk-level encryption for data at rest, AES 256-bit encryption for database backups, HTTPS with HSTS, and TLS v1.2 or greater for platform interactions and API access. Qualtrics does not encrypt data in use.

4.4 Availability The platform must maintain high availability and reliability aligned with IndiGo digital platform requirements.

Fully Complies

Qualtrics has maintained an average up-time of 99.97% since 2010, with uptime commitments generally above 99.9% documented in the Master Services Agreement.

Qualtrics targets zero downtime for production deployments; scheduled downtime is typically not required, and if it occurs it is announced several days in advance on the login screen, with details available through Qualtrics Support.

High availability and reliability are supported through highly modular, redundant systems across nine global data centers designed for 24/7/365 availability, with redundancy within and across data centers to enable upgrades and maintenance without user disruption.

The architecture is designed to eliminate single points of failure, including redundant communication lines and power supplies, and a microservices approach helps isolate rare downtime events to specific modules or features so most of the platform remains unaffected.

Operational reliability is reinforced by 24/7 monitoring using automated and manual processes, incident prioritization and coordinated response, root-cause analysis with lessons learned, ongoing capacity monitoring with the ability to add servers, and a customer-facing status page at <https://status.qualtrics.com/>.

4.5 Data Privacy Enhancements • Mandatory PII masking in session replays and behavioral logs • Configurable consent and data retention policies

Fully Complies

Qualtrics Session Replay in Digital Experience Analytics masks all input form fields by default, and by default it will not capture any PII from user input form fields unless it is explicitly configured by you or the IndiGo team. You can also control masking by masking all content, choosing what to mask, or allowing no masking, and masking changes are not retroactive so previously captured sessions would need to be deleted to remove already-captured data.

Consent controls are configurable in the session replay Recording and Consent settings and are turned on by default, with options to record after users opt in or to record when the web page loads. Qualtrics Data Retention features let you retain survey response data indefinitely or set custom retention periods, and you can permanently delete all data for a survey or project, supported by self-service tools to delete and download data during the term. After the subscription term ends, Qualtrics will delete all customer data remaining on servers hosting the Cloud Service unless applicable law requires retention.

[4.6 AI Governance • Explainability of AI outputs • Ability to configure AI-driven recommendations \(manual vs automated actioning\) • Audit trails for AI-based decisions](#)

Partially Complies

Qualtrics supports explainability and interpretability through mechanisms built into AI features such as Insights Explorer, Qualtrics Assist, and Conversational Feedback (Adaptive Follow-Up); AI-generated content is clearly identified with the "Qualtrics AI" icon, outputs are labeled, and users receive warnings if content may be harmful.

Qualtrics supports both high-level insight automation and fine-grain manual analysis using capabilities like custom dashboards, interactive widgets, and topic deep dives so IndiGo can validate AI outputs with granular manual analysis; customers can also enable or disable AI features, set user permissions, and control which data, including sensitive data, is processed by AI functions.

For AI-driven recommendations, Qualtrics provides AI-based Personalized Action Recommendations that include rationale and can be verified with teams using Action Idea Boards; Qualtrics AI Response Task can automate workflows such as summarizing text, generating personalized replies, translating content, and analyzing images or documents within survey and event workflows.

For auditability and governance, Qualtrics maintains detailed AI system documentation (including purpose, scope, potential impacts, performance metrics, and model validation results) and runs regular monitoring, auditing, and review processes, with clearly defined roles and responsibilities across AI system design, development, deployment, and monitoring.

V. Vendor Capabilities

5.1 Organizational Profile

Company overview

Fully Complies

Company Overview Qualtrics is the world's leading Experience Management (XM) provider. Our platform makes it easy to collect customer, employee, product, and brand research. We call this experience data (X-data), which provides insights into the thoughts, feelings, and wants of your customers and employees. We have 15,000 clients worldwide made up of enterprises, academic institutions, and government agencies, including 85+ percent of the Fortune 100, and 99 of the top 100 US business schools who rely on Qualtrics to consistently build products that people love, create more loyal customers, develop a phenomenal employee culture, and build iconic brands. - Website: <http://www.qualtrics.com> - Founded: 2002 - Founders: Scott Smith, Ryan Smith, Jared Smith, and Stuart Orgill - Headquarters: 333 W. River Park Dr. Provo, UT 84604 - Parent Company: Qualtrics International, Inc. - Description: Qualtrics provides enterprise data collection and analysis products for market research, customer interaction, and employee performance. Company Background In 2002, Qualtrics was founded by a father-son duo in a basement with the belief that we could revolutionize the way people did market, customer, and employee research. Beginning with university researchers and then expanding into all industry areas, our goal was to make research simple enough for an intern to conduct, yet robust and sophisticated enough for advanced business analysts and market researchers. In January 2019, SAP acquired Qualtrics for \$8.8 billion. A year and a half later, SAP announced its intention to take Qualtrics public, completing that vision on January 28, 2021, when Qualtrics issued an IPO and became a publicly traded entity with SAP remaining the majority stakeholder. Two and a half years later, on June 28, 2023, Silver Lake, the global leader in technology investing, in partnership with Canada Pension Plan Investment Board (CPP Investments), acquired 100% of the outstanding shares Silver Lake did not already own, including the entirety of SAP's majority ownership interest. Qualtrics became an independent, privately held company (no longer publicly traded) positioned to drive category-defining innovation and efficient growth at scale. Silver Lake has been an investor in Qualtrics for many years and they are close to both our founding members and our executive team-both critical components to our continued growth and innovation. Jason Maynard was named Qualtrics' new Chief Executive Officer in February 2026. A proven technology executive with 30 years of experience scaling world-class software businesses, he joins Qualtrics from Oracle, where he was Executive Vice President of Revenue Operations. On May 18, 2026, Qualtrics announced the completion of the acquisition of Press Ganey Forsta. The Press Ganey Forsta acquisition adds the trusted standard for patient experience in healthcare to the Qualtrics XM dataset, combining decades of proprietary healthcare data and regulatory measurement systems with the industry's leading XM AI & data platform for human experience management. That body of data, and the AI it powers, makes the combined platform stronger for every customer, across every industry. Qualtrics remains headquartered in Provo, Utah, and Seattle, Washington.

Years of experience in DX analytics platforms

Fully Complies

Qualtrics has been providing world-class market research solutions for academia, B2C, B2B, and many other industries since 2002. Customer Experience functionality was released in 2007, with the

XM Platform including Customer Experience, Employee Experience, and Brand Experience being introduced in 2015. Today, Qualtrics has more than 15,000 clients worldwide, and 4,500 employees and has posted very strong quarter-over-quarter revenue growth and notable profitability since inception.

Global and aviation industry experience

Fully Complies

Qualtrics operates at global enterprise scale, with offices across regions including Sydney, Melbourne, London, Paris, Munich, and Dublin, plus an engineering office in Krakow, and data centers around the world to support a global customer base. Customers span 95+ countries, the platform supports 70+ languages, and Qualtrics provides live 24/7 phone and email support plus dedicated account management for global programs. The platform is used for high-volume, multi-country programs, including one billion surveys distributed annually by customers, more than two million platform users, and global support teams spanning the Americas, Europe, and Asia-Pacific.

In aviation, Qualtrics supports programs for large, global enterprises, including Delta Airlines and Airbus.

Please see attached Virgin Australia - CX - Case Study.pdf.

JetBlue + Qualtrics Case Study : <https://www.qualtrics.com/customers/jetblue/>

5.2 Implementation Experience

Prior deployments of DX analytics solutions

Partially Complies

Qualtrics is a global leader in Digital Experience (DX) and Customer Experience (CX) analytics, powering data-driven optimization for some of the world's largest commercial aviation carriers. Our platform is purpose-built to handle massive traffic volumes, dynamic booking funnels, and real-time behavioral insights without impacting frontend application latency.

Below are highly relevant examples of prior deployments within the aviation sector that map directly to InterGlobe Aviation's (IndiGo) current operational scope:

1. Leading Indian Airlines (Full-Lifecycle Digital & Event-Based CX Deployment)

- **Scope & Context:** Deployed initially as a transactional milestones program, which has since expanded into a decentralized, real-time behavioral and milestone tracking engine.
- **DX Channels Covered:** Native Mobile App via SDK integration and responsive Web properties via digital intercepts.
- **Key Use Cases Implemented:** Capturing real-time traveler friction at critical milestones (booking engine, digital check-in flows, lounge access, and baggage claim) to allow rapid service recovery and eliminate experience gaps.

2. Leading Airlines in Southeast Asia (Global Digital Intercept Optimization)

- **Scope & Context:** Large-scale deployment of digital intercept mechanisms across a global multi-country and multi-currency passenger base.
- **DX Channels Covered:** Main web portal and digital booking interfaces.

- **Key Use Cases Implemented:** Implementation of live, "always-on" customer feedback anchors and conditional behavioral triggers designed to reduce booking drop-offs and track platform health.

3. Leading Airlines in Middle East (Behavioral Diagnostic Integration)

- **Scope & Context:** High-volume deployment focused on user intent tracking and interface diagnostics across high-traffic digital properties.
- **DX Channels Covered:** Global web platforms.
- **Key Use Cases Implemented:** Leveraging digital intercepts tied directly to page behavioral cues to optimize digital conversion paths.

Experience implementing journey-level feedback systems for digital commerce platforms

Fully Complies

Qualtrics has optimized websites since 2010 and currently supports digital commerce optimization through Qualtrics Frontline Digital, which is designed to understand the digital visitor and customer journey and drive higher conversion with valuable digital feedback across web and in-app experiences. It supports journey-level listening through page-level feedback, abandonment surveys, overall site experience research, and post-transaction surveys to identify and remove barriers to conversion and act on insights that improve outcomes.

Qualtrics' Customer Frontlines Digital platform works with the Qualtrics Customer Experience platform, including cross-channel listening for segmentation and analysis across CX data, conversational and text analytics for predictive insights, and out-of-the-box digital CX program methodology with pre-built surveys, digital intercepts, and dashboards. Qualtrics XM for Customer Experience rolls feedback from multiple sources and touchpoints into an interactive, actionable closed-loop system with real-time dashboard processing, configurable business rules and case management, and integrations to external systems and partners, including support for integration via REST API and SFTP-based contact file exchanges to trigger and personalise transactional and journey-based outreach.

Experience integrating with platforms such as Salesforce

Fully Complies

Qualtrics has deep integration experience with Salesforce through two options, the Basic Extension and the Qualtrics App in Salesforce, designed to connect experience data and operational data for data-driven decisions and improved customer experiences. The Basic Extension supports extracting Salesforce data, triggering surveys from Salesforce events, and mapping Qualtrics responses back to Salesforce records using Response Mapping actions including insert, update, upsert, delete, and posting to Chatter, plus Salesforce Data Extractor, Report Extractor, and Outbound Message workflow triggers.

The Salesforce App in Salesforce includes the Basic Extension capabilities and enables employees to work in Qualtrics directly within Salesforce, including sending large-scale surveys from the Salesforce UI via email and SMS to Leads, Contacts, or Campaigns, viewing survey responses in Salesforce via a Survey Responses object, viewing filtered embedded widgets on Salesforce records, and viewing role-based embedded CX dashboards with administrator-controlled permissions. Beyond Salesforce-specific options, Qualtrics supports 100+ out-of-the-box integrations and a Qualtrics REST API for automating push/pull data flows and building bespoke

integrations, with professional services and partners available to scope and implement custom integrations and data passes, and hundreds of integrations completed each quarter. Qualtrics also provides no-code connector integrations with Salesforce for bi-directional data and workflow sync, including triggering Qualtrics surveys based on actions in connected systems and embedding survey results into custom CRM objects.

• At least 2 case studies demonstrating: • Conversion uplift OR abandonment reduction • Reduction in digital failure-driven contact center volume • Measurable revenue or cost-to-serve impact

Fully Complies

Qualtrics case studies and industry research highlight how organizations use experience management software to reduce digital friction, prevent cart or journey abandonment, and lower digital failure-driven call center volume.

1. bolttech: Contact Center Reduction and Conversion Uplift

- The Problem: Global insurtech company bolttech needed to address high customer churn and service-to-sales conversion roadblocks caused by fragmented digital experiences.
- The Action: bolttech deployed Qualtrics' experience and conversational analytics to monitor digital journeys, map customer interactions across touchpoints, and pinpoint the exact moments customers abandoned their policies.
- Measurable Impact: By identifying and rectifying digital friction points (such as confusing checkout flows and broken payment steps), bolttech achieved a 12% reduction in customer churn rates. Furthermore, using targeted, real-time insights during service-to-sales interactions, they increased sales conversions by almost 50%.

2. Large Healthcare Provider: Measurable Revenue and Digital Failure Impact

- The Problem: A major healthcare system observed significant digital friction on its web and mobile portals, wherein patients encountered bugs interfering with online payments and care scheduling. This failure-driven friction caused a spike in contact center call volumes.
- The Action: The provider used Qualtrics Digital Experience Analytics to track "rage clicks" and error events, allowing teams to isolate and fix specific website bugs interfering with the patient portal.
- Measurable Impact: By removing these digital roadblocks, the health system successfully prevented patients from giving up on their web journeys. This lowered the volume of digital failure-driven calls routed to contact centers and resulted in an annual net collection rate increase of \$1.3 million.

3. JetBlue: Abandonment Reduction and Cost-to-Serve Impact

- The Problem: JetBlue struggled with various digital issues, including audio/speaker faults in airport terminals and online booking ambiguities, leading to high support ticket and phone volumes.
- The Action: JetBlue integrated Qualtrics conversation analytics to process unsolicited customer signals (surveys, emails, and voice calls) across all channels to instantly identify broken touchpoints.

- **Measurable Impact:** By using the platform to uncover and instantly address these hidden friction-inducing bugs, JetBlue successfully reduced repetitive failure-driven contact center inquiries while increasing overall Net Promoter Scores (NPS).

5.3 Product Capability

Behavioral analytics capabilities

Fully Complies

Qualtrics provides real-time behavioral analytics with session replay and behavioral heuristics such as rage clicks and mouse thrashing to identify broken digital journeys and drop-off points, using behavioral, experiential, and operational data to connect online user behavior to customer sentiment and business impact.

Qualtrics can build rich interaction profiles and journey segments by ingesting data from the browser, web sessions, custom JavaScript expressions, and Google and Adobe Analytics variables, and it can target website visitors based on session behaviors and related criteria such as session history, page count/time on site, arrival time, device type, referrer information, URL contents, and website data including cookies, JavaScript expressions, and HTML content.

AI-based text analytics

Fully Complies

Qualtrics provides AI-based text analytics through Text iQ, including sentiment analysis for open-ended survey responses to understand respondents' emotions and attitudes. Text iQ uses natural language processing to categorize responses as very positive, positive, neutral, negative, or very negative, and you can apply sentiment analysis to nominated question responses to quickly gauge overall sentiment trends. Text iQ also supports topic extraction and sentiment drivers analysis, and offers customizable sentiment models that can be tailored to specific industries or use cases.

Text analytics is integrated across the platform, so topic criteria (including combinations of topics) can be used for filtering in reports and dashboards, incorporated into user roles and role-based access, and included in organizational hierarchies. AI model training is not customizable by customers; Qualtrics' Core AI team trains proprietary AI models hosted within Qualtrics data centers under a Model Risk Management process, while you can still tailor certain AI-powered features such as topic models by adjusting parameters like use case, persona, or industry.

Digital CSAT

Fully Complies

Qualtrics supports digital CSAT measurement at key moments in the customer journey using flexible CSAT templates, including expert-built survey templates with Ph.D. designed methodology, prebuilt logic and survey structure, and automated workflow. CSAT reporting can use 'top 2 box' analysis to show who is satisfied and who is not, and it can pair open-ended feedback with ratings to dig into 'why.' and identify improvement opportunities.

CSAT can be monitored and analyzed in the same platform alongside other CX metrics, with dashboards that support blended, point-in-time, and trended views, plus segment breakouts and driver performance/driver analysis to focus improvement on the highest-leverage areas. Dashboards and scorecards support drill-downs, filtering (including by linked customer/CRM or transactional data, timestamp, geo-location, topics, and channels), real-time reporting, personalized views,

benchmarking, scheduled email digests, and ad hoc reporting/cross-tabulations, with access permissioned by user login and role-based access (including SSO). Qualtrics can also combine operational data (O-Data) and experience data (X-Data) via API, SFTP, and manual uploads to support client-level views and a 360 view of customers, including updating key customer indicators such as likelihood to churn after each interaction.

Journey analytics dashboards

Fully Complies

Qualtrics Journeys dashboards let you measure, visualize, and analyze respondent experiences across multiple touchpoints so you can move beyond siloed, point-in-time views, and customize dashboard metrics such as the Respondent Funnel.

They support journey analysis across objectives, personas, moments that matter, touchpoints, and key data sources, helping you understand insights, diagnose issues and opportunities, assess impact to optimize budgets and effort, and identify innovation areas; journey views can also be filtered by regions and locations and shared with leaders to drive accountability and action.

Journey setup includes three steps.

- Define your journey by identifying the key moments you want to capture
- Configure the journey dashboard by mapping it to journey data sources and mapping journey points on the widget
- Create a Journey Chart Widget to visualize journey data and stages, which can represent single interactions, groups of transactions, channels, or logical groupings of decisions

For employee journey analytics, Employee Journey Analytics (EJA) combines existing employee data from multiple projects into a single dataset for analysis, and CrossXM Analytics can combine EX, CX, and operational data into one dataset to identify key drivers and inform EX investments that improve CX and business metrics.

Cart abandonment detection mechanisms

Fully Complies

Qualtrics supports cart abandonment detection using exit-intent targeting in Website / App Feedback, where a "mouse-out" approach detects when a visitor moves the mouse up and to the right as though they are exiting and then drops an intercept such as a popover or infobar to capture feedback on why they are leaving.

In the Digital XM Solution for Commerce, cart abandonment is handled via a dedicated Cart Abandonment intercept; it can present Cart Abandonment surveys and creatives such as Cart Abandonment (Pop Over) and Cart Abandonment - PopUnder (Pop Under), and it can combine cart abandonment questions with post transaction questions when the visitor indicates they are not finished shopping.

Qualtrics can also capture cart-related interaction signals using Custom Events in session replay, including events like adding an item to a cart, clicking a link, or completing a purchase; these events are configured in session replay settings, support up to 30 custom events per project, and use standard HTML and JavaScript (JS) events.

Demonstrated roadmap toward journey orchestration and personalization

Fully Complies

Qualtrics' roadmap is explicitly oriented toward predictive, personalized, and proactive experiences at scale, balancing new functionality with reliability, flexibility, ease of use, and quality so customers can evolve programs quickly and make changes with autonomy.

For journey orchestration, the 2026-2027 roadmap includes AI-assisted journey capabilities and cross-channel unification, including Agentic Journey Building to accelerate journey mapping from weeks to a single day using existing data and best-practice recommendations, plus Omnichannel Data Integration to unify web, mobile, email, and social signals into a single customer-experience view; it also includes Experience Agents that can autonomously engage in real time, such as Digital Intercept Agents that respond when users show signs of website frustration, and Experience SDK plus Intercept Appearance Studio to deploy and tailor mobile-optimized intercept experiences with less developer effort.

5.4 Implementation Approach

Vendors should describe:

Implementation methodology

Fully Complies

Qualtrics uses a flexible implementation approach tailored to each client, combining proven methods from thousands of implementations with options that balance support, guidance, and expertise while helping clients own their success.

Qualtrics scopes an implementation plan with the client, covering milestones, key deliverables, and timelines across planning and execution, testing and troubleshooting, cutover and go-live, data migration, training and reference material tailoring, and rollout strategy and planning activities; a Statement of Work defines and tracks deliverables including platform configuration, testing, and integration processes, and Qualtrics also establishes a communication strategy at kickoff with program changes managed through the change management process outlined at kickoff.

Governance is managed by the Qualtrics delivery team with weekly calls to align on project plan status, key activities, and prioritization, and a dedicated project manager supports communications, governance standards, design readiness and kickoff, detailed project planning, execution tracking against plan, and escalation management to address deviations.

For XM for Employee Experience implementations, Qualtrics applies a phased plan that may be adjusted to client needs: Analyze and Design (current state assessment, governance and strategic alignment, program design including technical architecture and user personas, and project planning), Build and Migrate (configure surveys, dashboards, workflows, and automations; set up roles and authentication; HRIS mapping and integration; historical data migration; testing and QA including security testing and integration testing), Test and Launch (UAT, user-tailored training including Qualtrics XM Basecamp options, data and integration sync, and launch readiness communications), and Support and Optimize (ongoing success planning and monitoring, optimizations, and program expansions with service levels from full-service to self-service).

Typical EX timing ranges are 2–6 weeks for Analyze and Design, 8–20 weeks for Build and Migrate, 2–8 weeks for Test and Launch, and ongoing for Support and Optimize, with exact timelines determined upon selection and dependent on program complexity and factors such as content review and acceptance, localization, and client engineering availability.

Integration approach with IndiGo digital platforms & systems

Partially Complies

Qualtrics integrates with external systems through out-of-the-box extensions and APIs, enabling customers to connect Qualtrics with other software and act on insights within their existing tools.

Qualtrics supports 100+ out-of-the-box integrations and extensions across common platforms, and it also provides a REST API to push and pull data to and from the Qualtrics platform, including automating repetitive processes and exchanging information with systems such as CRM, HRIS, HCM, marketing automation, and other systems.

Integration methods range from manual export/import to SFTP or batch transfers and real-time API-based integrations; for example, actions in Salesforce (case closed, opportunity won, contact created) can trigger a Qualtrics survey.

Qualtrics customers can export data via the web interface in formats including CSV, SPSS, and XML.

Qualtrics Professional Services and experienced partners can assist with building integrations or data passes, and support levels vary by first-party versus third-party extensions, with more complex modifications potentially requiring engineering services or custom API solutions.

Deployment timelines

Fully Complies

Qualtrics typically delivers a phased implementation from kickoff to delivery that is contingent on program complexity, Qualtrics's partner Infosys will be conducting the implementation over 12-16 weeks; an exact timeline is determined upon selection.

Translation can add as little as one day for light projects with minimal languages and up to a few weeks for higher-complexity projects with more languages, depending on whether in-platform translation capability or an external third-party translation services vendor is used.

For Strategic Brand, a standard implementation typically lasts 10–12 weeks, with estimated phases of 1–2 weeks for kickoff and survey design, 2 weeks for survey programming/quality control/client UAT, 1 week for translations if needed, 3–4 weeks for dashboard design and build, and data collection and reporting timelines that are TBD based on the audience/sample plan and reporting needs; after handover, the team stays engaged at your preferred cadence to help ensure effective use and expected value, covered updates, scope alignment, and next-phase planning for future contract years.

For survey launches in primarily self-sufficient programs, lead time is driven by the time administrators can devote, supported by an intuitive point-and-click interface designed to help users create and administer surveys quickly with minimal training.

Any Qualtrics research project can be implemented within 1–8 weeks depending on the level of customization and services required.

Post-implementation support model

Fully Complies

Post-implementation, licensed Qualtrics platform administrators can access 24/7 live technical support by phone, chat, or email at no additional cost, with authenticated support to ensure only legitimate users receive assistance and with support logs maintained for context on recurring issues and faster help; support is provided in English plus eight other languages (including French, German,

Spanish, and Portuguese), with non-English languages primarily available during the regular business hours of the language region and not guaranteed 24/7.

Support can be initiated via the Support Site Contact Us flow and includes trained technical specialists across support divisions in Provo, Dublin, Mexico City, and Sydney, with most phone requests resolved on the first call; Qualtrics also provides a digital support environment (support pages, walk-throughs, webinars, and an AI assistant chatbot for technical questions) plus a user community for collaboration and best-practice sharing.

For ongoing success after go-live, Qualtrics provides a post-implementation Technical Success Manager for continuous technical guidance aligned to your program's technical architecture and business objectives, and continues support and monitoring through system health checks, user activity monitoring, issue resolution, integration updates and management, platform optimizations, and program expansions, supported by success planning and strategic business reviews.

Where contracted, Enterprise Support (as part of the Success Package) provides priority access to senior product specialists via prioritized queues, unlimited on-demand scheduled calls for troubleshooting and platform queries for designated program administrators, end-to-end ownership of issues and escalations, and up to four Technical Project Reviews per year (Launch Readiness Review, Technical Risk Assessment, License Optimization Review, and Launch Guidance).

Qualtrics' SLA warrants average monthly production availability of 99.93% (subject to defined exclusions) and provides fee credits upon request based on monthly downtime thresholds; support response times are not included in the SLA, since response time varies by issue complexity.

For service continuity targets, the Recovery Time Objective is 24 hours to resume normal operations and Services and the Recovery Point Objective is usually less than 4 hours to restore Customer Data, with further details referenced in the Business Continuity & Disaster Recovery section of the Cloud Security and Privacy Framework.

5.5 Non-Commercial information

i. Solution Overview

Detailed description of the proposed Digital Experience (DX) platform and its core capabilities.

Fully Complies

Qualtrics Digital Experience helps you understand end-to-end digital customer journeys, identify common and problematic touchpoints, and pinpoint the key drivers and pain points impacting overall site experience, including goal attainment, likelihood to return, and likelihood to recommend.

Qualtrics provides Website/App Feedback to capture and analyze digital website behaviors through targeted intercepts based on user info, browser sessions, website data, date/time, web service, and user actions, supporting use cases such as cart abandonment, lead generation, content/page effectiveness, usability testing, promotional content, ad effectiveness, visitor profiling, and panel recruitment.

Qualtrics Digital Experience Analytics (DXA), part of Frontline Digital, combines real-time feedback with a direct view of digital behavior through session replays, frustration detection, heatmaps, funnels, dashboards, automated alerts, and role-based insights in Qualtrics Digital Assist, helping teams find drop-offs, understand root causes, and prioritize fixes.

- Session replay reconstructs how users experience your website, with conditional targeting options based on URL, URL query parameters, or IP addresses; sessions can be reflected

in XM Directory contact profiles, and Digital Assist provides a Sessions table with filtering by survey questions or sentiment plus AI-powered session summaries to reduce manual review

- Frustration detection tracks rage clicks, mouse thrash, error clicks, and dead clicks to surface high-friction moments and trends over time
- Heatmaps visualize interaction and frustration hotspots, while funnel analytics highlights drop-off points across defined conversion paths

The program approach emphasizes three maturity stages: Track and Diagnose for high-level journey and issue analysis, Journey Deep Dive for granular insights via methods such as mobile assessment, usability testing, abandonment studies, and targeted in-journey web and mobile intercepts, and Digital Closed Loop Management to operationalize a continuous cycle of improvement with empowered follow-up, prioritization rules, and senior leader involvement.

DXA includes privacy and security controls such as encryption in transit and at rest, masking (with input fields masked by default unless explicitly configured), optional IP capture only if explicitly added as a visitor detail, and consent-based recording (enabled by default, with options to record after opt-in via API or on page load).

Explanation of how the platform supports journey-level feedback collection across digital channels.

Fully Complies

Qualtrics supports journey-level feedback collection by combining structured and unstructured, solicited and unsolicited signals across digital channels to create end-to-end customer journey visibility and 360° customer views.

It provides 70+ ways to collect experience data across channels and devices, including surveys delivered via links, CRM integrations, SMS, and offline; website/app feedback using targeted surveys and intercepts with 20+ targeting variables (including geolocation, segments, and site behavior); social reviews from 125+ sources; contact center omnichannel analytics across calls, posts, chats, texts, and emails; and digital experience analytics such as session replay and behavioral heuristics to diagnose broken journeys and drop-off points.

For journey mapping and in-journey research, Qualtrics uses advanced text analytics to match issues to the correct phase of the journey, then goes deeper by analyzing topics and sub-topics and their impact on journey stages and business metrics, including new metrics created from customer language such as the percentage of confusion or anger and mentions of potential churn.

Qualtrics Digital Experience emphasizes a maturity approach to journey improvement: Track and Diagnose for high-level journeys and issues; Journey Deep Dive for granular, journey-specific insights using omnichannel measurement and targeted in-journey web and mobile intercepts with precise survey questioning (3-5 questions); and Digital Closed Loop Management to run a cyclical program that brings the customer voice into the organization and focuses teams on root-cause fixes.

Page-level feedback widgets enable persistent, in-the-moment collection while customers are on a website; these are easy to deploy, can be created in minutes without IT or code changes, and can capture insights beyond "yes" and "no" via logic, while XM Directory plus Website Feedback can link responses to contacts, apply contact frequency rules, and target specific customer segments.

XM for Frontlines Digital is designed to listen in real time across digital touchpoints, collect non-disruptive solicited and unsolicited signals at the right time, adapt programs with minimal resources, maintain operational and experience data in a single system of record, build profiles and

segments with frequency control, and use AI-driven insights from open text (sentiment scores, trends, automated alerts) to surface experience gaps, prioritize actions, and drive outcomes like improved web/app experience, better retention and expansion, and stronger digital self-service.

To connect the journey across devices and channels, Qualtrics can track customer digital behavior across multiple devices and, where a unique identifier exists, stitch signals together; it can also extract identifiers such as email addresses and phone numbers from customer comments to help join feedback across channels and direct/indirect sources.

For comprehensive journey views, Qualtrics aggregates survey feedback and unstructured sources (contact center calls, chats, social posts, review sites) and applies AI-powered Natural Language Understanding to contextualize speakers and assess effort, emotions, empathy, and intent; over time, this is combined with operational and transactional data to build rich profiles and dashboards that explain what is happening and why, with insights that trigger actions via native automated workflows and recommendations tied to improvement drivers.

For program execution, Qualtrics can integrate with operational systems using an open API and commonly via SFTP-based contact file transfer so the source system notifies Qualtrics of customers who had a touchpoint, enabling personalized distribution through the selected channel and deeper analysis over time.

Capability to capture both structured surveys and open-ended customer feedback.

Fully Complies

Qualtrics supports capturing structured (solicited) survey feedback and unstructured feedback in the same platform, including standard Brand Tracker surveys plus Strategic Brand + Discover for unsolicited unstructured inputs from channels such as chat, communities, social, and calls; unstructured processing can range from static uploads to NLP coding, based on the desired output.

Qualtrics surveys can include open-ended free text questions anywhere in the survey flow, and Survey Flow with out-of-the-box integrations can route open-ended comments, with the respondent's permission, to the right teams to resolve issues and close the loop; reporting dashboards can also combine structured and unstructured data for filtering, collaboration, and stakeholder reporting.

Overview of behavioral analytics features such as rage click detection, dead click monitoring, idle session identification, and exit intent tracking.

Fully Complies

Qualtrics provides behavioral analytics through session replay and frustration signals that highlight moments when users exhibit frustration on mobile web and desktop. When session replay is enabled, it tracks four behaviors: Rage Click, Mouse Thrash, Error Click, and Dead Click; Rage Click is at least 4 consecutive clicks with less than 200 pixels and 300 milliseconds between each click, and Dead Click is a click on a web button or hyperlink that should have produced an action and does nothing.

These signals can be reviewed in the Session Replay tab to see video evidence of user actions, and the session replay table includes fields such as dead clicks, mouse thrashes, rage clicks, and error clicks, alongside session details like duration, pages visited, and replay link. Qualtrics also supports heatmaps that show how customers interact with each element on a page and where frustration occurs, including filtering by frustration signals such as rage clicks, error clicks, dead clicks, and mouse thrashes. After session replay is enabled and sessions are recorded, you can visualize

session data and frustration signals in a dashboard to see trends over time and identify where peak frustration is occurring, and Qualtrics also offers AI-powered summaries for individual sessions to speed up understanding of what happened without watching the full replay.

Description of AI-driven analytics capabilities for text-based feedback analysis and issue categorization.

Fully Complies

Qualtrics provides native, AI-driven text analytics for open-text feedback through Text iQ, which applies machine learning and natural language processing to discover patterns and trends at scale, automatically surfaces trending topics to the right stakeholders, and keeps discovered topics integrated across Qualtrics reporting so teams can classify into topic hierarchies, filter, analyze, and share insights quickly.

For issue categorization, Qualtrics uses a hybrid NLP approach that combines rules-based methods with machine learning to balance explainability and scalability, and it supports topic categorization via out-of-the-box industry and use-case templates, custom rule creation, and Theme Detection (machine learning) that groups prevalent themes and can identify unknown themes or audit categorization accuracy, including surfacing blind spots not already categorized.

Qualtrics enriches and prioritizes issues using clause-level sentiment scoring on an 11-point scale from -5 to +5, effort scoring from -5 to +5, and intent and emotion detection to isolate patterns like requests, praise, cries for help, churn, and legal disclosures; it automatically detects over 50 distinct emotions and supports out-of-the-box intent filters relevant for CX analytics.

Text iQ provides automated topic identification with AI-assisted topic recommendations, reusable topic models, configurable topic definitions (including custom topics), and sentiment labels (positive, neutral, negative, mixed); in English, Qualtrics states 95% accurate response-level sentiment labeling.

Qualtrics can improve the quality and depth of text feedback at the point of capture using Response Clarity and Adaptive Follow Up, which prompt respondents for clearer, more specific details and analyze patterns and sentiment in real time to adjust follow-up questions while the respondent is engaged; Qualtrics reports AI follow-ups produce 2x longer responses, 87% more topics, and 20% better detection of sentiment, effort, and emotion.

Text analytics outputs can be operationalized across the platform because topic criteria can be used for filtering in reports and dashboards, incorporated into user roles and role-based access, and included in organizational hierarchies.

ii. Implementation Methodology

Proposed implementation approach including planning, configuration, deployment, and validation phases.

Fully Complies

Our implementation methodology follows a structured, phased approach designed to ensure smooth program setup, efficient deployment, and post go-live stabilization. The methodology focuses on aligning business objectives, configuring the required feedback and analytics capabilities, enabling key integrations, validating the solution, and supporting adoption after launch.

The program will be delivered through a phased methodology covering foundation setup, solution build, deployment, and post-go-live support. The approach begins with project initiation, stakeholder alignment, and journey discovery, followed by configuration of surveys, intercepts, feedback mechanisms, and behavioral monitoring components. Required integrations will be enabled to support operational workflows, and the solution will undergo structured testing and validation before deployment. Post go-live, hyper care support will be provided to stabilize operations, resolve issues, and optimize performance.

Project Initiation → Journey Mapping & Feedback Strategy → Platform Configuration → Integration Enablement → Testing & Validation → Deployment → Hypercare Support → Stabilization & Optimization.

[Integration methodology for connecting the DX platform with IndiGo's existing digital platforms.](#)

Fully Complies

Our integration methodology for IndiGo's digital platforms will leverage **lightweight Web Intercept JavaScript tags** for web and native iOS/Android SDKs for Mobile to deploy feedback tracking components with minimal impact on performance and user experience.

The implementation will align with key digital journeys and touchpoints identified during discovery, enabling contextual feedback capture and behavioral signal monitoring across web and app channels.

[Approach for deploying feedback widgets and behavioral tracking components across web and mobile platforms.](#)

Fully Complies

Deploy feedback widgets on web properties using a visible, clickable link, button, icon, or similar item that opens a Qualtrics form; static links can be configured as anonymous or not anonymous depending on the use case.

Implement Website/App Feedback intercept experiences using dynamic formats such as popover, sliders, feedback tab, info bars, custom HTML, popunder, embedded link, HTTP redirect, pop up, relay, and social media; website intercepts can also be styled with custom CSS.

Roll out web deployments via common tag managers used with Website/App Feedback projects: Tealium, Adobe DTM (Dynamic Tag Manager), Adobe Launch, Google Tag Manager (GTM), and Ensighten.

For native mobile applications, Qualtrics client engineering works with clients to provide SDK code and implementation to enable Website/App Feedback in mobile applications; Qualtrics also supports integrating with mobile applications in a variety of ways to solicit in-app feedback. Behavioral Components are supported only for Web Intercepts.

For cross-channel integration and programmatic enablement, Qualtrics provides developer tooling including JavaScript, HTML, and CSS markup in the survey builder, plus open APIs and a REST API (api.qualtrics.com) to support integration workflows including importing and exporting data.

[iii. Integration Capability](#)

[Description of integration architecture and supported APIs.](#)

Fully Complies

Qualtrics is a SaaS application fully hosted by Qualtrics and supports integrations with many 3rd party solutions primarily through open APIs and open industry standards.

Supported integration methods include API, REST web services, SFTP, batch file exchange, and more; integrations require HTTPS protocols, and SFTP-based file transfers can use PGP encryption if the customer chooses.

Qualtrics provides a REST API to push and pull data to and from the platform to automate processes such as importing and exporting data, scheduling mailings, automating respondent contacts, emails, and reminders, and integrating with external systems including CRM for bi-directional workflows (for example, triggering surveys based on events in another system and storing results in both Qualtrics and the CRM).

The Qualtrics API uses request patterns where information can be sent to, updated in, removed from, or returned from Qualtrics using GET, POST, PUT, and DELETE methods with JSON responses; web services occur over HTTPS and can return multiple formats including CSV, XML, JSON, and SPSS.

Authentication for API access is token-based or OAuth2; the token is unique for your brand and remains valid until regenerated, while OAuth2 uses a bearer token valid for 1 hour and then uses the bearer token in the HTTP authorization header X-API-TOKEN.

Common API-supported transactions include managing surveys, users, user groups, distributions, importing survey responses, exporting completed survey data (including New Export APIs and Legacy v3 Exports), using Conversational APIs, and managing Right to Erasure.

Qualtrics also supports industry standards for SSO including SAML 2.0 and Shibboleth, and messaging including SMTP and SPF.

API documentation is available at <https://api.qualtrics.com> and an overview is available at <https://www.qualtrics.com/support/integrations/api-integration/overview/>; available integrations are also listed at <https://www.qualtrics.com/marketplace/integrations/>.

Capability to support secure integration with enterprise digital platforms.

Fully Complies

Qualtrics supports secure integration with enterprise digital platforms through a RESTful API, web services, and batch file exchange that are compatible with middleware platforms and Enterprise Service Bus (ESB) solutions, with API-based integrations supporting GET, POST, PUT, and DELETE requests that return JSON responses.

It supports integration patterns ranging from manual export/import to SFTP and batch transfers and real-time API integrations, and it can automate pushing and pulling data to and from external systems such as CRM, HRIS, HCM, marketing automation, and other platforms.

For security controls around access and data movement, it supports SSO integrations with Microsoft Active Directory Federation Service (ADFS) and any Identity Provider that meets SAML technical requirements, uses TLS v1.2 with HSTS for connections, encrypts data stores and responses using AES-256, supports encrypted offsite backups, and enables PGP encryption for SFTP-based file transfers when customers choose to use it.

Qualtrics also provides 100+ out-of-the-box integrations and a developer platform to build bespoke integrations, backed by professional services and partners to help implement integrations and data passes.

Data exchange mechanisms for analytics, dashboards, and monitoring systems.

Fully Complies

Qualtrics supports data exchange for analytics and dashboarding through REST API, SFTP, webhooks, and manual uploads, including an Imported Data Project (IDP) to automate external data flows into the platform and map them into dashboards alongside Qualtrics-collected experience data on common identifiers.

Qualtrics can integrate with external analytics and BI ecosystems via native connectors and integrations, including a pre-built integration with Adobe Analytics that enables visitor targeting for embedded website survey requests, passing Adobe Analytics variables into Qualtrics reporting, and sending Qualtrics survey data into Adobe Analytics.

Qualtrics supports exporting data and analytics for downstream systems via manual exports and automated API/SFTP workflows, with export formats including CSV, TSV, Excel, XML, SPSS, JSON, and more, and dashboard/report exports including PDF, JPG, PNG, CSV, and XLSX, plus options to embed widgets in external tools using HTML snippets and iFrame.

For monitoring and ongoing visibility, Qualtrics dashboards provide real-time visibility, role-based access controls, interactive filtering (including widget-to-widget filtering), trend charting over time, and the ability to distribute updates through digests and recurring email exports, with alerting and case management available in dashboards.

iv. Operational Support Model

Description of support structure for post-implementation operations.

Fully Complies

For post-implementation operations, Qualtrics maintains an ongoing customer team and always-on support so your program stays adopted, stable, and continuously improved.

Your ongoing support structure includes:

- 4 Weeks Hyper Care Support from the Delivery Team for any Issue Resolutions post Go-Live
- Account Manager: manages the commercial partnership, supports technology scoping, and handles contracting and pricing negotiations to support XM initiatives.
- Technical Success Manager: drives platform adoption and value realization through road-mapping exercises and recurring business reviews.
- 24/7 live support: global in-house support is available via phone, email, and chat for troubleshooting, product bugs, and technical queries; support is authenticated so only legitimate users receive assistance, and support interactions are logged to provide context for recurring issues.
- Digital support resources: XM Support includes help content, trainings, tutorials, and an AI assistant chatbot; the Qualtrics Community enables users to collaborate, share best practices, and solve tough problems.

- Optional Hourly Support (if Required) from the Delivery team

To help teams move from analysis to action planning post-launch, Qualtrics provides action-planning guidance and can deliver an online action planning tool, follow-up survey guides, webinars, and consulting support; action plans can be set at multiple organizational levels, tracked and communicated in-platform, rolled up via hierarchical reporting, and collaborated on with comments and reminders.

Post-launch, Qualtrics continues success and monitoring to support continuous improvement and alignment to strategic objectives, including success planning, adoption support, strategic business reviews, system health checks, issue resolution, and ongoing platform optimizations and expansions as needed.

Incident handling process for platform-related issues.

Fully Complies

Qualtrics triages platform-related incidents by tracking customer-impacting issues in an online ticketing system, assigning priority based on impact, and coordinating rapid analysis and resolution via a conference bridge with representatives from relevant service teams; after resolution, teams document root cause, present the analysis to key personnel, and incorporate lessons learned into business processes.

The production environment is monitored 24/7 for reliability, performance, and security, with production servers, databases, and network devices sending logs to a SIEM that captures key events and alerts on configured thresholds; host-based intrusion detection runs on all servers, and customers can monitor current system status at <https://status.qualtrics.com/>.

For security incidents, Qualtrics follows Incident Response policies and procedures aligned to the Incident Response control family in NIST SP 800-53, supported by a 24/7 SOC team and an always-available engineer-on-call; if data is affected, customers are notified without undue delay after assessment and within two days, and the plan is tested at least annually with improvements captured through lessons learned.

For technical support escalations, Qualtrics monitors reported issues and resolves or escalates them based on severity and agreed service levels, with immediate handling processes for after-hours urgent issues such as outages and same-day escalation to appropriate engineering resources for serious problems; support is available 24/7.

Mechanism for monitoring platform health and performance.

Fully Complies

The Partner Delivery Team will monitor platform health and performance across both technical and functional dimensions. This includes tracking feedback widget and intercept performance, behavioral trigger execution, response capture, dashboard data accuracy, and Salesforce integration flows. During post-go-live hyper care, the deployment will be closely monitored to identify and resolve issues, fine-tune configurations, and ensure stability across critical digital journeys. This approach supports early issue detection, reliable data capture, and sustained operational performance.

Also, Qualtrics monitors platform health, performance, and security using intrusion detection systems, performance and health monitoring systems, and security event correlation, with production server, database, and network device logs centralized into a SIEM for monitoring and

alerting on defined thresholds and activities; logged events include logon, account management, privilege functions, and other system events, and host-based intrusion detection runs on all servers across all data centers to monitor key system directories for changes and other signs of compromise.

The environment is monitored 24/7 for reliability and performance via automated and manual processes with global operational support, and customer-impacting incidents are tracked in an online ticketing system with priority assignment, cross-team conference bridges for triage and resolution, and post-incident root cause analysis documented and fed back into business processes; customers can track current system status via <https://status.qualtrics.com/>, while internal dashboards provide real-time insight into log files and, internally, Grafana dashboards are used to monitor microservices, container scaling, and integration service performance and health with historical and trend views, alongside ongoing capacity monitoring and monthly internal availability/performance reviews.

v. Compliance and Data Governance

Data privacy and protection controls are implemented within the platform.

Fully Complies

Qualtrics implements in-platform privacy and data protection controls, including permission management to ensure users only access information relevant to their needs, plus the ability to designate fields as sensitive and restrict access to those fields to specific users.

The platform supports multiple anonymity and de-identification methods, including anonymous links that decouple feedback from personal identifiers, the "Anonymize Responses" option to remove personal information (such as IP addresses, location data, and contact information), dashboard anonymity thresholds (including comment thresholds) that require a minimum number of responses before results are displayed, and reporting safeguards to hide results until enough responses are collected; for EX use cases, it also supports pseudonymization to remove identifying information from employee responses in real time and Enhanced Confidentiality to apply thresholds to all data points and automatically group or hide small groups to prevent identification.

Qualtrics also states it has adopted privacy processes, policies, and procedures in compliance with applicable data protection laws for all customers; customers own and control all data as data controllers while Qualtrics acts as the data processor, and customers determine what data to collect, who to collect it from, where to collect it, the purpose, and when to delete it; the Qualtrics Privacy Statement is available at <http://www.qualtrics.com/privacy-statement/>.

Compliance with applicable regulatory frameworks governing customer data protection.

Fully Complies

Qualtrics complies with applicable data protection laws to the extent those laws impose obligations on Qualtrics as a Processor in connection with the Cloud Service specified in the Order Form. Qualtrics is GDPR certified and compliant as of May 25, 2018, and provides a self-service SaaS platform where the customer is the data controller and decides what data to collect, from whom, for what purpose, and when to delete it.

Qualtrics applies a privacy by design procedure across product review and development, with privacy issues identified through the internal product development cycle and legal review, and products are not authorized for release if outstanding privacy concerns remain.

For Australian Government requirements, the Qualtrics platform and company processes are IRAP assessed at the PROTECTED level against the security controls listed in the Australian Government ISM (aligned with the PSPF), and the platform is hosted and backed up in Australia at Amazon IRAP-assessed AWS data centres. Qualtrics also maintains certifications and artifacts including SOC 2 Type II, ISO 27001/27017/27018, ISO 42001, HITRUST, ISO 9001, penetration test reports, and a comprehensive security framework, with details requestable via the Trust Center (some items may require an NDA).

Qualtrics does not sell or rent customer or other contact information, limits employee access to those with a business need to know (with access logged and requiring user permission), and discloses customer information only when legally required with customer notice where allowable. Qualtrics provides self-service tools to help customers respond to data subject requests, and directs survey respondents to contact the customer who collected the data for customer-controlled processing activities.

Controls for secure storage, processing, and access to collected customer feedback data.

Fully Complies

Qualtrics Services logically store customer data in sophisticated databases for quick retrieval and faster processing; customers share the same infrastructure, and data are encoded so only the correct data will be sent to the requesting user. Data at rest are encoded to prevent unauthorized read access, and for more advanced encryption the Qualtrics Data Isolation feature uses AES-256 crypto and is available for an additional fee.

Access to data requires direct ownership (the user who created the survey) or implied access (for example, Brand Administrator or another user with access). Customers own and control all data as data controllers while Qualtrics acts as the data processor; customers determine what data to collect, who to collect it from, where to collect it, the purpose, and when to delete it, and Qualtrics treats all data as confidential and processes it equally regardless of meaning or intent. To help keep respondent data and PII confidential, the platform supports methods such as using a generic survey link, unlinking responses from respondents at the conclusion of the survey, and removing a user's ability to view PII; it also includes ExpertReview to notify survey builders when sensitive data is requested, and a configurable tool to flag sensitive data requests and redact sensitive data from responses. Survey responses are retained until users delete them, links to specific customer IDs are preserved as long as the response is stored, and the audit trail is held indefinitely unless an administrator deletes data using GDPR functionality, which can permanently delete survey responses.

vi.Product Roadmap

The vendor should provide a detailed product roadmap outlining the planned evolution of the DX platform. This will enable IndiGo to assess the long-term viability and innovation potential of the proposed solution.

Fully Complies

Qualtrics maintains a product roadmap that is reassessed and evolved frequently based on active market analysis, customer feedback, internal requirements, and emerging technologies, with major upgrades at least three times per year and minor updates, functional enhancements, and fixes at a higher frequency; as a corporate policy, we do not provide electronic copies of the Qualtrics Product

Roadmap, but we will make Product Management available for a full and detailed live roadmap presentation (in person or via web conferencing).

A publicly available, regularly updated roadmap is also available at <https://www.qualtrics.com/product-roadmap/> to keep customers aware of new and upcoming product developments.

i. Planned Feature Enhancements

Key roadmap features slated for 2026 and 2027 (including Voice of the Customer and Digital) include XM App Enhancements, Ticketing Enhancements, Intercept Appearance Studio, and Experience SDK; broader platform priorities include continuing investment in customer, employee, and market research technology enabled through industry leading analytics and agentic AI.

Upcoming capabilities related to customer feedback analytics include CX Program Hub for a single-page view of program health and recommendations, Business Outcome Simulator to model how driver improvements influence outcomes like NPS, and Omnichannel Data Integration to unify cross-channel insights from web, mobile, email, and social into a single widget.

Improvements in behavioral analytics and user journey monitoring include Agentic Journey Building, which uses an AI-assisted builder to accelerate journey mapping, and Digital Experience Analytics capabilities that centralize session replay and frustration signals in Digital Assist with the ability to mine patterns and identify anomalies by behavior, verbatim topics, or sentiment score.

Planned enhancements in AI-based text analytics and sentiment detection include ongoing investment in Artificial Intelligence, Large Language Models, and Agentic AI, along with advanced NLU enrichments that generate effort, emotion, and actionability scores to speed analysis of open-end verbatims; Qualtrics also plans AI-powered search so users can query their data to identify high-impact drivers and receive recommended responses based on context and predicted next action.

ii. Digital Experience Optimization Capabilities

Future capabilities for automated journey optimization and personalization include Experience Agents (Qualtrics Agentic AI) designed to autonomously resolve issues in real time at scale, and Frontline Recommended Actions that provide a short list of AI-powered recommendations to guide managers on the steps to take to resolve key operational issues.

Planned enhancements in behavioral intervention mechanisms include the Digital Intercept Agent, where Digital Intercept Agents automatically respond when users show signs of website frustration and provide timely assistance through pop-up messages or conversational chat interfaces.

iii. Analytics and Reporting Enhancements

Readiness for advanced insight generation includes ongoing investment to be predictive, personalized, and proactive at scale, plus Qualtrics capabilities such as predictive analytics and machine learning that can automatically identify key trends, run predictive ROI/impact modeling on outcomes like NPS/Satisfaction, and generate human language reporting on correlations and importance to desired outcomes.

Planned improvements in dashboard visualization and reporting include dashboard summarization widgets, executive report generation for XM programs, and role-based field access for dashboards for greater granularity and data governance.

Enhancements supporting deeper journey performance insights include Digital Experience Analytics dashboards that visualize frustration trends over time and help teams quantify impact across visits,

plus funnel analytics and heatmaps to identify underperforming conversion paths and where frustration occurs on a page.

iv. Integration and Platform Expansion

Qualtrics supports no-code extensibility via an open developer platform with out-of-the-box integration partners such as Adobe Analytics, Quantum Metrics, and JIRA, and we can integrate insights into tools teams already use, such as Microsoft Dynamics or BI / data visualization tools.

Future support for additional channel integrations includes bringing chat data at scale into Qualtrics from contact center systems, with upcoming first-party voice extractors including Genesys Cloud, NICE CXOne, Amazon Connect, and 8x8.

v. Technology and AI Evolution

Qualtrics continues to invest in AI and machine learning to drive action across its customer base, including XM/os2 enabled through a \$500M investment in AI and focused on richer profiles, trend and gap detection, and organization-wide action; Qualtrics has also developed a comprehensive AI risk management framework aligned with the NIST AI Risk Management Framework and achieved FedRAMP High Authorization and ISO/IEC 42001:2023 certification for its AI capabilities.

Enhancements enabling predictive analytics for digital experience management include Qualtrics' use of predictive and prescriptive analytics to surface key drivers and prioritize action, with planned AI-powered search and recommended responses informed by real-time and historical context and predicted next action.

The roadmap should clearly indicate feature timelines, planned releases, and expected capability improvements, enabling IndiGo to align the solution with its long-term digital transformation initiatives.

Fully Complies

Qualtrics uses an agile development model with iterative two-week release cycles that deliver new features, bug fixes, security patches, and upgrades through a formal change management process, including documentation, risk assessment, prioritization, planning, testing, approval, and implementation via a centralized ticketing system.

Qualtrics communicates new feature updates to clients upon release through weekly product updates and corresponding support site pages, and all users are on the latest version of the platform.

vii. Project Governance and Methodology

- The vendor should demonstrate how the proposed solution supports IndiGo's progression from digital experience measurement to an operationalized Digital Experience Management (XM) model, enabling continuous learning, rapid intervention, and scalable journey optimization. The governance structure should clearly define roles, responsibilities, communication mechanisms, and decision-making processes throughout the implementation and operational phases.

Fully Complies

Qualtrics supports operationalising digital experience measurement through experience-data capture and integrations that connect survey and operational systems, including Website/App Feedback for web and native mobile apps, bi-directional CRM integrations via the Qualtrics REST API, and an Adobe Analytics integration reference for targeted survey deployment.

For continuous learning and rapid intervention, the platform is monitored 24/7 for reliability and performance, with production logs sent to a SIEM that monitors and alerts on defined thresholds and activities; customer-impacting incidents are prioritised and tracked in an online ticketing system, followed by root-cause analysis and incorporation of lessons learned into business processes.

For governance with defined roles, responsibilities, and communication cadences, Qualtrics operates an ISMS overseen by a Security Leadership Team that meets monthly and is responsible for overseeing security and privacy policy creation/updates, risk assessments/audits, and monitoring compliance; it also maintains organisation-wide security roles and committees, including a Security Governance Committee that convenes twice per month and an Incident Response Committee that meets at least once per month.

For decision-making around risk, validation, and ongoing optimisation of AI-enabled capabilities, Qualtrics documents AI system purpose and context, performs risk assessments, establishes and documents performance metrics used to guide deployment decisions, engages internal and external stakeholders for feedback throughout the AI lifecycle, and runs a model launch readiness process that includes stakeholder review/approval, compliance checks, and final validation against performance and safety criteria.

viii. High Level Implementation Plan –

The implementation plan will focus on deploying the DX platform across the key stages of IndiGo's digital booking and check-in journeys in a phased and controlled manner.

1) Phase 1 – Project Initiation Activities include: • Project kickoff and stakeholder alignment • Finalization of implementation scope and objectives • Establishment of governance structure • Preparation of detailed project plan Key Deliverables: • Project charter • Implementation schedule • Stakeholder communication plan

Fully Complies

Qualtrics uses a phased implementation approach that begins with early alignment between stakeholders and the Qualtrics Delivery Team, including a kickoff to introduce parties and confirm scope, and weekly calls to align on project status, key activities, and prioritization.

During the initial stage, Qualtrics aligns the program to strategic priorities and desired outcomes, defines governance, documents program requirements, and builds a detailed deployment timeline and phased plan with reporting.

Implementation delivery is guided by a Statement of Work that defines and tracks deliverables and responsibilities, including platform configurations, testing, and integration processes; Qualtrics also aligns a communication strategy and maintains a change control repository to document and manage changes without compromising deadlines.

2) Phase 2 – Journey Mapping and Feedback Strategy • Activities include: • Mapping the full digital journey • Identification of critical touchpoints for feedback capture • Definition of behavioral monitoring signals Key Deliverables: • Journey feedback strategy • Behavioral analytics configuration plan

Fully Complies

Qualtrics will work with IndiGo to map the 7 journey touchpoints identified by IndiGo to assess the captured experience information for each key moment, and establish any missing capture points. For digital journey mapping and a feedback strategy, Qualtrics recommends identifying high-level site experience metrics such as goal attainment, likelihood to recommend (NPS), and likelihood to return,

and using a combination of an overall site experience study at exit plus persistent opt-in feedback across pages.

For behavioral monitoring signals and the behavioral analytics configuration plan, Qualtrics captures behavioral, experiential, and operational data, including advanced digital analytics, session replay, and behavioral heuristics such as rage clicks and mouse thrashing, to identify broken digital journeys and drop-off points. It can integrate behavioral and operational inputs such as Google and Adobe Analytics variables, browser data, web session data, or custom JavaScript expressions to build richer interaction profiles and segmentation for journey analysis at scale.

3) Phase 3 – Platform Configuration • Activities include: • Configuration of DX platform components • Development of feedback widgets and surveys • Setup of behavioral monitoring rules Key Deliverables: • Configured feedback collection framework • Behavioral analytics setup

Partially Complies

Qualtrics supports configuring DX platform components by coordinating with IndiGo to add Website / App Feedback code to the website, then testing the program on a QA or beta site before initial launch.

Qualtrics supports development of feedback widgets and surveys by building creatives that show on the website and defining intercept logic for when it should appear and who it should sample, then developing the survey and reviewing questions to fit the targeted audience and digital feedback goals.

Qualtrics supports setup of behavioral monitoring rules and behavioral analytics by enabling session replay and configuring conditional targeting criteria for sessions to be recorded (for example based on URL, URL query parameters, or IP addresses), while also tracking frustration behaviors such as rage clicks, mouse thrashing, error clicks, and dead clicks, and visualizing session and frustration signals in dashboards within Qualtrics Digital Assist for Website Intercept.

4) Phase 4 – Integration with Digital Platforms Activities include: • Integration with Salesforce support platform for escalation or service assistance Key Deliverables: • Integrated DX platform architecture • Data exchange validation

Partially Complies

Qualtrics integrates with Salesforce through two options, the Basic Extension (OOB Functionality) and the Qualtrics App in Salesforce, supporting connection between experience data and operational systems to strengthen data-driven decisions and customer experiences.

For transactional and workflow-driven use cases, the Basic Extension supports extracting Salesforce data, triggering surveys from Salesforce events, and mapping Qualtrics responses back to Salesforce records; it requires connecting the Qualtrics account to the Salesforce instance via the Workflows tab.

For data exchange back into Salesforce, Response Mapping supports insert, update (with a unique key), upsert, delete (with a unique key), and post to Chatter at a user or object level.

For extracting data from Salesforce, SFDC Data Extractor supports Account, Contact, and Opportunity, while SFDC Report Extractor can extract reports without object-type limitations; SFDC Outbound Message can listen for outbound API calls from Salesforce to trigger Qualtrics workflows for transactional surveys.

For in-Salesforce execution and visibility, the Qualtrics App supports sending large-scale relational surveys from the Salesforce UI via email and SMS to Leads, Contacts, or Campaigns, viewing Qualtrics insights and survey responses on contact records, displaying filtered embedded widgets on Salesforce object records, and embedding role-based Qualtrics CX dashboards in an iFrame aligned to administrator-set user permissions.

For escalation or service assistance, Qualtrics offers native integration with Salesforce and Zendesk for ticketing, and recommends using Qualtrics closed-loop ticketing to tie ticketing metrics to survey metrics for a more complete picture of the customer experience.

For data exchange validation during migration and loading activities, Qualtrics recommends validating test files and running User Acceptance Testing, supported by data mapping validation (including data type consistency), migration log tracking, record-count reconciliation, random sample checks against source data, validation of key relationships post-migration, end-user validation against business needs, and final sign-off and stakeholder validation; Qualtrics relies on the client to provide accurate source data and applies integrity measures once data is sent to Qualtrics.

5) Phase 5 – Testing and Validation • Activities include: • Functional testing of feedback collection mechanisms • Validation of behavioral analytics signals • Verification of dashboard reporting accuracy Key Deliverables: • Test validation report • Performance validation results of the solution

Partially Complies

Qualtrics performs functional testing to validate solution components (including workflows) and, where required, integration testing to confirm data flows and interactions operate correctly and maintain data accuracy.

For feedback collection mechanisms such as Website/App Feedback intercepts, users can preview intercepts in test mode and use Test Mode to validate display logic, appearance, and functionality across devices and browsers without impacting the production web site.

Qualtrics verifies reporting and analytics outcomes during testing to confirm migrated data produces expected outcomes, and it also supports real-time reporting and dashboards with fast data retrieval to enable timely, actionable insights.

6) Phase 6 – Deployment • Activities include: • Deployment of feedback widgets across digital journeys • Activation of behavioral monitoring components • Enablement of dashboards for operational teams Key Deliverables: • Production deployment confirmation • Dashboard access for stakeholders

Partially Complies

Qualtrics can deploy feedback widgets across digital journeys by coordinating with IndiGo to add Website / App Feedback code to the website, building creatives/intercepts that determine when feedback appears and who it samples, building and reviewing the survey, and launching after testing on a QA or beta site.

Qualtrics' Website & App Feedback supports behavioral-style targeting through intercept rules and engaging messages driven by variables such as user info, browser sessions, website data, date/time, web service, and actions, including 20+ behavioral, location, and device-type variables to target visitors at key moments.

Qualtrics can enable dashboards for operational teams and stakeholders through role-based reporting and dashboards that provide detailed visualizations with configurable access levels. Dashboards can be generated and distributed on any cadence, users can be notified of updates, and stakeholders without Qualtrics access, can receive PDF versions on an automatic basis.

Dashboards are also shareable with View/Edit access, support collaboration via commenting, and can be viewed in the Customer Care App for frontline employees such as agents, managers, and QA teams.

7) Phase 7 – Stabilization and Optimization • Activities include: • Monitoring initial operational performance • Fine-tuning behavioral triggers and survey triggers • Supporting digital teams in interpreting feedback insights Key Deliverables: • Stabilization report • DX performance baseline metrics

Partially Complies

Qualtrics provides post-launch Support & Optimize services focused on ongoing success and monitoring, including performance tracking, trend analysis, reporting analysis, stakeholder meetings, and system health checks, user activity monitoring, and issue resolution.

For fine-tuning triggers, Qualtrics supports configuring digital intercept behavior and sampling, testing on a QA or beta site prior to launch, and refining based on Qualtrics best-practice review.

Qualtrics Digital Experience also supports targeted, in-journey web and mobile intercepts with journey-based triggers, using usage analytics and persistent feedback volume to determine where to target visitors.

For Digital Experience Analytics, conditional targeting can be set so sessions are recorded only when criteria are met, including URL, URL query parameters, or IP addresses. Qualtrics case management can also trigger cases and alerts based on quantitative and/or qualitative survey responses such as detractor scores, poor service, low satisfaction, lead generation, and contact requests.

VIII. Commercial

Period of validity of rates to be mentioned in the response.

Fully Complies

30 days from RFP submission

2. Contract Period / Duration The initial contract period for the Digital Content Management Website and Mobile app shall be for a duration of One (1) year from the Effective Date of the Agreement

Fully Complies

Accepted

No subcontracting of any part of the scope to any third party will be allowed.

Fully Complies

Yes. Qualtrics uses subprocessors, and it also subcontracts to a variety of third parties on an engagement basis for professional services such as implementation services.

For software development specifically, Qualtrics states that all of its technology is developed by Qualtrics employees.

Supplier is expected to propose penalties or suitable service credits in case of failure in providing services as per agreed SLA.

Fully Complies

This will be subject to GTCs agreed between both parties.

Payment Term will be 60 days after receipt of the invoice. No upfront payment.

Partially Complies

Payment will be as per agreed terms between both parties.

All civil / implementation contracts will require a Performance Bank Guarantee (PBG) with a value equal to the cost of civil work/implementation which shall be valid for 3 months after work completion/go-live date.

Does Not Comply

Not applicable as this does not involve any civil work / implementation. This will be a software platform implementation.

Commercial Response Format-Table

S. No.	Header	Cost
	Platform Annual Subscription	
1	Frontline Digital [700,000 responses]	
2	DXA Sessions [15 Million]	
	Implementations Costs one time	

3	One time fees [By Infosys - Qualtrics partner]	
	<i>Indicative pricing only, exact volumes to be discussed in detail.</i>
