Executive Summary

IndiGo, as India's largest airline and one of the fastest-growing aviation companies globally, serves millions of passengers across its extensive domestic and international network. With the rapid expansion of digital touchpoints—including flight bookings, loyalty programs, and customer engagement platforms—the airline manages a continuously growing volume of customer identity data across multiple operational systems.

Currently, customer identities are distributed across key platforms such as the **Navitaire reservation system**, the **BluChips loyalty program**, and the **CIAM platform (Azure Entra)**. While these systems individually support critical operational and customer engagement functions, the absence of a unified identity resolution framework can lead to situations where a single customer may exist in multiple systems with slightly different identity attributes (such as variations in phone numbers, email addresses, or profile details). This fragmentation creates challenges in maintaining a **consistent, accurate, and unified customer view across the enterprise**.

As IndiGo continues to enhance its digital ecosystem and customer experience initiatives, the ability to **accurately identify, reconcile, and unify customer identities across systems** becomes a foundational capability. A robust identity resolution framework will enable the airline to improve data consistency, strengthen customer profile accuracy, support personalized engagement strategies, and ensure reliable synchronization between operational platforms such as booking systems, loyalty programs, and identity management services.

This proposal outlines Lagozon Technologies' approach to designing and implementing an **Identity Resolution Framework** that will enable IndiGo to establish a **single, reliable representation of each customer across its digital ecosystem**. The proposed solution focuses on intelligently matching and reconciling customer records across systems using a combination of **deterministic and probabilistic matching techniques**, ensuring both accuracy and flexibility when resolving identity variations.

At the core of the proposed approach is a structured process that:

- Consolidates identity attributes from systems such as **Navitaire, BluChips, and CIAM**
- Applies rule-based deterministic matching for high-confidence identity matches
- Utilizes probabilistic matching techniques to identify likely matches across partial or inconsistent identity attributes
- Establishes a **unified customer profile** representing a resolved identity across systems
- Maintains traceability and confidence scoring to ensure transparency in identity resolution decisions

By implementing this framework, IndiGo will be able to create a **consistent and reliable customer identity layer** that supports multiple operational and strategic initiatives across the organization. This unified identity foundation will help improve customer experience, enable more accurate loyalty program alignment, and ensure that customer interactions across booking, loyalty, and digital engagement channels reference a single trusted identity.

In addition, a unified identity capability will strengthen IndiGo's ability to deliver **seamless digital passenger journeys**, enabling more personalized communication, consistent recognition of customers across platforms, and improved alignment between booking records and loyalty profiles.

Lagozon Technologies brings deep expertise in **data engineering, data integration, and advanced analytics**, helping enterprises design scalable data platforms that unify fragmented data ecosystems and enable actionable insights. Our experience in building enterprise-grade data and AI solutions enables us to design an identity resolution architecture that is **secure, scalable, and aligned with IndiGo's existing technology landscape**.

The proposed engagement will involve close collaboration with IndiGo's technology and business teams to analyze the current identity ecosystem, design the identity resolution logic, implement the required integration and reconciliation workflows, and validate the framework through structured testing and deployment phases.

Through this initiative, IndiGo will be able to establish a **robust and scalable identity resolution capability** that supports its evolving digital strategy while ensuring the accuracy, consistency, and reliability of customer identity data across its enterprise systems.

In addition to improving identity consistency across systems, the proposed framework will establish a scalable customer identity foundation that supports IndiGo's long-term digital initiatives, including personalized passenger experiences, loyalty program optimization, and data-driven customer engagement. The solution is designed to integrate seamlessly with IndiGo's existing technology ecosystem while remaining flexible for future platform expansion and digital innovation.

1. Company Profile

1.1. Lagozon Technologies: Who We Are

Lagozon Technologies Pvt. Ltd. is a next-generation **AI, Data Engineering, and Data Analytics consulting company** focused on helping enterprises unlock value from their data through scalable, secure, and intelligent technology solutions. Founded in 2012, Lagozon has established delivery capabilities across India, Singapore, the United States, Canada, and the UAE supporting organizations in their digital transformation and data modernization journeys.

Our mission is to simplify enterprise complexity by designing **data-driven platforms and AI-powered solutions** that enable faster decision-making, operational efficiency, and improved customer experiences. We work closely with business and technology teams to build solutions that integrate seamlessly into existing enterprise ecosystems while remaining scalable for future growth.

Lagozon has delivered projects across industries such as **aviation, healthcare, manufacturing, retail, BFSI, and logistics**, helping organizations modernize data platforms, improve analytics capabilities, and deploy AI-driven applications that enhance business outcomes.

Our approach combines **deep technical expertise with strong business understanding**, enabling us to deliver solutions that are not only technically robust but also aligned with the operational goals and governance requirements of enterprise organizations.

1.2. Our Technology Offerings

Lagozon provides a comprehensive portfolio of **Artificial Intelligence, Data Engineering, and Data Analytics solutions** that help organizations transform raw data into intelligent insights and scalable digital capabilities.

Artificial Intelligence & Intelligent Automation

Lagozon's AI capabilities enable enterprises to leverage advanced technologies such as machine learning, natural language processing, and intelligent automation to enhance business processes and digital services.

Key capabilities include:

- **AI-Powered Data Intelligence** – Applying machine learning models to derive insights from structured and unstructured data sources.
- **Intelligent Document Processing** – Automating extraction and analysis of information from documents, forms, and enterprise records.
- **Natural Language Interfaces & Conversational AI** – Enabling intuitive interactions with data and systems through natural language queries and AI assistants.
- **AI Agents and Intelligent Workflows** – Designing AI-powered systems that automate complex workflows and improve operational efficiency.

These AI capabilities enable organizations to build **intelligent digital systems that enhance decision-making, automate complex processes, and deliver improved customer experiences.**

Data Engineering

Our data engineering services focus on building reliable and scalable data foundations that enable organizations to integrate, manage, and process large volumes of data from multiple systems.

Key capabilities include:

- **Data Integration & Pipeline Development** – Designing robust data pipelines that consolidate data from enterprise systems, applications, and external sources.
- **Cloud Data Platform Implementation** – Building modern data platforms on cloud environments to support analytics, AI, and business intelligence workloads.
- **Data Lake & Data Warehouse Architecture** – Implementing structured and scalable data storage frameworks for enterprise analytics.
- **Real-Time Data Processing** – Enabling streaming and near real-time data ingestion to support operational analytics and decision-making.

Data Analytics

Lagozon helps organizations transform enterprise data into meaningful insights that support operational visibility and informed decision-making.

Key capabilities include:

- **Business Intelligence & Interactive Dashboards** – Designing enterprise dashboards that provide real-time visibility into operational and strategic metrics.
- **Advanced Analytics & Predictive Modeling** – Leveraging statistical and machine learning techniques to forecast trends and detect patterns.
- **Data Visualization & Reporting** – Delivering intuitive visualization frameworks that enable business users to explore and interpret complex data easily.
- **Self-Service Analytics Enablement** – Empowering business teams with tools and frameworks to access and analyze data independently.

1.3. Our Technology Partners

Lagozon collaborates with leading global technology platforms to deliver reliable, scalable, and enterprise-ready solutions for our clients.

Our partnerships include leading providers across **cloud computing, data platforms, analytics, and artificial intelligence ecosystems**, enabling us to design solutions that integrate seamlessly with enterprise technology environments.

By leveraging these technology ecosystems, Lagozon ensures that client solutions are built using **industry-standard platforms, best practices, and secure enterprise architectures**, supporting long-term scalability and innovation.

2. Understanding of IndiGo's Current Landscape & Requirements

Based on the RFP, requirement discussions, and solution exploration sessions, IndiGo intends to enhance its customer identity management capabilities by establishing a robust identity resolution framework that can unify customer profiles across multiple enterprise systems.

IndiGo's digital ecosystem supports several operational platforms that manage passenger identities across booking, loyalty programs, and digital authentication services. As the airline continues to expand its digital services and customer engagement initiatives, ensuring a consistent and reliable representation of customer identities across these systems becomes increasingly important.

The proposed initiative focuses on addressing challenges related to duplicate records, inconsistent identity attributes, and fragmented customer profiles, while enabling a unified identity layer that supports accurate customer recognition across IndiGo's digital platforms.

2.1. Current Identity Ecosystem

Customer identity information within IndiGo's environment is managed across multiple systems that support different operational functions within the airline's digital ecosystem.

The key systems involved include:

- **Navitaire Reservation System:** Navitaire functions as IndiGo's primary Passenger Service System (PSS), responsible for managing flight bookings, passenger records, and reservation transactions. Passenger identities are typically created as part of the booking process and stored within reservation profiles.
- **BluChips Loyalty Management System:** BluChips manages IndiGo's customer loyalty program, maintaining customer membership profiles associated with loyalty benefits, rewards, and engagement activities.
- **CIAM Platform (Azure Entra):** IndiGo utilizes a Customer Identity and Access Management (CIAM) platform to manage authentication and secure access for customer-facing digital applications. The CIAM platform supports user registration, login management, and identity authentication across digital services.

While these systems manage identity attributes relevant to their respective functions, customer identities across them may not always represent a single unified profile, creating challenges in maintaining consistent customer records.

2.2. Key Identity Management Challenges

The discussions and system review sessions highlighted several challenges associated with maintaining a unified and accurate customer identity across platforms.

- **Fragmented Customer Identities:** Customer information may exist across multiple systems with variations in identity attributes such as email addresses, phone numbers, or profile details. These variations can lead to multiple records representing the same individual.
- **Duplicate and Inconsistent Records:** Differences in how identity attributes are captured across systems can result in duplicate or partially matching profiles. For example:
 - Same email associated with different phone numbers
 - Same phone number linked to different profiles
 - Separate profiles created through booking and loyalty enrollment processes

Such inconsistencies make it difficult to determine whether records correspond to the same customer.

- **Limited Unified Customer View:** Without a consolidated identity resolution framework, customer data remains distributed across operational systems. This limits the ability to maintain a single trusted representation of each customer across booking, loyalty, and digital platforms.
- **Data Standardization Challenges:** Identity attributes such as phone numbers, email formats, and country codes may be stored differently across systems. These variations require normalization before accurate matching can be performed.

2.3. Functional Requirements

To address these challenges, the identity resolution framework should support capabilities that enable accurate identification and reconciliation of customer records across systems.

Key functional requirements include:

- **Identity Matching Across Systems:** Identify potential matches between customer records stored in Navitaire, BluChips, and CIAM.
- **Deterministic Matching Rules:** Establish high-confidence matches based on consistent attributes such as email address, phone number, or other unique identifiers.
- **Probabilistic Matching Techniques:** Support matching methods that identify likely matches when identity attributes are partially inconsistent or incomplete.
- **Customer Profile Consolidation:** Enable the creation of a resolved customer identity profile representing a unified view across systems.
- **Confidence Scoring and Traceability:** Maintain transparency in identity resolution decisions by assigning confidence indicators and preserving traceable matching logic.

2.4. Non-Functional Requirements

In addition to functional capabilities, the solution should satisfy several non-functional requirements to ensure operational reliability and scalability.

Requirement	Description
Scalability	The framework should support large volumes of customer identity records and continuous synchronization as new records are created across systems.
Performance & Reliability	Identity resolution processes should operate efficiently to support system synchronization without impacting operational workflows.
Data Security & Privacy	Customer identity data must be handled in accordance with enterprise security standards and applicable data protection policies.
Data Integrity	Matching logic should ensure accuracy while minimizing the risk of incorrect identity merges.
Auditability & Transparency	The solution should maintain traceable records of identity resolution decisions for validation and operational review.

3. Expected Business Outcomes

The implementation of a structured identity resolution framework will enable IndiGo to establish a **consistent and reliable customer identity foundation** across its digital ecosystem. By reconciling customer identities across booking, loyalty, and authentication platforms, the airline will be able to improve both operational data consistency and customer engagement capabilities.

The key business outcomes expected from this initiative include:

- **Unified Customer Identity:** The framework will enable IndiGo to maintain a single trusted representation of each customer across systems such as Navitaire, BluChips, and CIAM. This unified identity layer will reduce duplicate profiles and improve overall data consistency.
- **Improved Customer Experience:** By ensuring accurate customer identification across platforms, IndiGo will be better positioned to provide consistent and seamless interactions across digital touchpoints, including booking, loyalty participation, and customer account access.
- **Enhanced Loyalty Program Alignment:** A consolidated identity framework will strengthen the linkage between passenger booking records and BluChips loyalty profiles, improving the accuracy of loyalty tracking and customer engagement initiatives.
- **Improved Data Quality and Operational Efficiency:** Resolving duplicate and inconsistent customer records will improve the quality of customer data across enterprise systems, enabling operational teams to work with more accurate and reliable information.
- **Stronger Foundation for Future Digital Initiatives:** A unified identity layer will provide a scalable foundation for IndiGo's future digital services, customer engagement strategies, and data-driven initiatives, ensuring that customer identities remain consistent across evolving platforms and applications.

4. Scope of Work

Based on the requirements outlined in the RFP and the discussions held with IndiGo's technology teams, Lagozon proposes to design and implement a **Customer Identity Resolution Framework** that enables reconciliation and consolidation of customer identities across IndiGo's key digital platforms.

The engagement will focus on designing and implementing a framework that can analyze customer records across systems such as Navitaire, BluChips, and the CIAM platform, identify potential identity overlaps, and establish a resolved customer identity representation that supports consistent customer identification across platforms.

The scope of work covers the design, development, testing, and deployment of the identity resolution capability along with integration support with the relevant systems in IndiGo's customer identity ecosystem.

4.1. In-Scope Activities

The following activities are included within the scope of the proposed engagement:

- **Requirement Analysis & Solution Design**
 - Review and validation of identity resolution requirements with IndiGo stakeholders
 - Assessment of relevant customer identity attributes across Navitaire, BluChips, and CIAM systems
 - Definition of the identity resolution architecture and processing framework
 - Definition of identity matching rules and reconciliation logic
- **Identity Resolution Framework Development**
 - Development of data ingestion and preprocessing mechanisms
 - Implementation of data standardization and normalization processes
 - Configuration of deterministic and probabilistic identity matching rules
 - Development of the identity resolution engine for reconciling customer records
- **Data extraction and ingestion mechanisms** to collect relevant identity attributes from Navitaire, BluChips, and CIAM systems for identity comparison and reconciliation.
- **Unified Customer Identity Layer Development**
 - Creation of a resolved customer identity representation
 - Linking of associated customer identities across source systems
 - Establishment of a unified customer profile structure for downstream use
- **System Integration Support**
 - Integration with the CIAM platform for identity reconciliation workflows
 - Support for interaction with Navitaire and BluChips systems for identity comparison and validation
 - Configuration of identity synchronization mechanisms where applicable
- **Testing & Deployment**
 - Functional testing of identity resolution logic and workflows
 - Validation of identity matching accuracy using sample datasets
 - Deployment of the solution within IndiGo's designated environment
 - Go-live validation and operational readiness support

Scope Constraints and Coverage – Identity Resolution Implementation:

- The scope of this engagement is limited to the implementation of the Customer Identity Resolution and Customer 360 solution as defined in this proposal. No other use case is considered as part of the proposal.
- The implementation will cover only those data elements, processes, integrations, and workflows that are directly required to support identity resolution use cases, including identity matching, consolidation, and unified customer profile creation.
- Any requirements, data processing, integrations, or functionalities that fall outside the scope of identity resolutions such as broader data platform enhancements, analytics use cases, campaign management, or unrelated system changes will be considered out of scope and will be addressed through a formal Change Request (CR) process.

4.2. Key Deliverables

The key deliverables expected as part of this engagement include:

Deliverable	Description
Identity Resolution Solution Design	Architecture and design documentation for the identity resolution framework
Identity Matching Framework	Implementation of deterministic and probabilistic identity matching logic
Data Standardization Processes	Normalization mechanisms for identity attributes such as email, phone number, and country codes
Unified Customer Identity Model	Framework for representing consolidated customer identities across systems
Integration Components	Interfaces required for interaction with CIAM and other relevant systems
Testing & Validation Reports	Documentation of testing activities and validation results
Deployment & Go-Live Support	Support during deployment and production rollout
Business Requirement Document (BRD)	Documentation capturing the detailed business requirements, workflows, and system interactions for the identity resolution solution.
Data Flow Diagrams (DFD)	Diagrams illustrating how customer identity data flows between source systems, the identity resolution engine, and downstream platforms.
Software Requirement Specification (SRS)	Detailed functional and technical specification of the solution including identity matching logic, integration requirements, and system capabilities.
Requirements Traceability Matrix (RTM)	Mapping of business requirements to design, development, testing, and deployment components to ensure full requirement traceability.
High-Level Design (HLD)	Architectural design describing system components, integration patterns, and solution architecture.
Low-Level Design (LLD)	Detailed technical design including data models, processing workflows, identity matching configuration, and API interfaces.

Given the interdependent nature of the listed deliverables, certain artifacts may be consolidated into unified documents where there is logical overlap and alignment of content. For instance, design-related components (HLD, LLD, Architecture, DFDs) or requirement-driven documents (BRD, SRS, RTM) may be combined to improve coherence, reduce redundancy, and ensure consistency across documentation.

The final structuring of deliverables will be determined based on:

- Logical grouping of content and dependencies
- Availability and maturity of inputs/data
- Project phase and stakeholder requirements

All agreed deliverables will still be comprehensively covered, either as standalone documents or as clearly demarcated sections within consolidated artifacts, without compromising completeness, traceability, or quality.

4.3. Out-of-Scope Items

Unless explicitly agreed upon as part of the engagement, the following activities are considered outside the scope of this proposal:

- Major modifications or redevelopment of existing systems such as **Navitaire, BluChips, or CIAM platforms**
- Development of new customer-facing applications or digital channels
- Large-scale historical data cleansing or manual data correction activities
- Implementation of enterprise-wide customer data platform (CDP) capabilities beyond identity resolution
- Long-term managed services or operational support beyond the defined post-go-live support period

Any additional requirements identified during the course of the project may be addressed through a mutually agreed change management process.

5. Proposed Solution

5.1. Solution Overview

The proposed solution architecture follows a **modular microservices-based architecture** designed for scalability, security, and integration with existing enterprise systems.

The architecture consists of the following layers:

1. Data Source Layer
2. Data Integration Layer
3. Identity Resolution Engine
4. Identity Graph Layer
5. Identity Resolution Utility
6. Customer 360 Profile Repository
7. API and Service Layer
8. Security and Governance Layer
9. Real-Time Monitoring and Reporting

5.1.1. Data Source Layer

Customer identity data originates from several enterprise systems including:

- Identity Access Management (Microsoft Entra)
- Navitaire Booking System
- Loyalty Management System
- Customer Data Platform
- Enterprise Data Hub
- Mobile and Web Applications
- Customer Care Platforms
- Payment Systems

These systems maintain customer identity attributes such as phone numbers, email addresses, loyalty IDs, demographic information, and transaction data.

Due to distributed registration points, these systems may contain inconsistent or duplicate customer records.

5.1.2. Data Integration Layer

The Data Integration Layer enables seamless data exchange between source systems and the identity resolution platform.

Integration mechanisms include:

- API-based integrations for real-time communication
- Batch ETL pipelines for historical identity reconciliation
- Event-driven ingestion for identity-related events
- Data cleansing and normalization services.

This layer ensures consistent formatting of identity attributes and prepares identity data for matching processes.

5.1.3. Identity Resolution Engine

The proposed Identity Resolution Platform follows a structured, multi-stage processing framework designed to ensure accurate and scalable customer identity reconciliation across enterprise systems. The framework combines deterministic rules with machine learning–based probabilistic models to evaluate potential duplicate identities and determine appropriate resolution actions.

The identity matching pipeline consists of the following stages

1. Data Standardization

Before identity matching begins, customer data from different source systems is standardized to ensure consistent formatting and improve matching accuracy.

This stage performs normalization and cleansing of identity attributes including:

- phone number formatting and country code normalization
- email address standardization
- removal of whitespace and formatting inconsistencies
- normalization of names and location fields
- validation of identity attributes.

Data standardization ensures that variations caused by formatting differences do not impact identity matching accuracy.

2. Attribute Conflict Resolution Strategy

When multiple source systems contain conflicting values for the same customer attribute, the solution applies a configurable conflict resolution framework aligned with IndiGo’s business rules.

The default prioritization logic will be:

- **Recency-Based Priority (Primary):** The most recently updated attribute value is considered the most reliable.
- **Source System Priority (Secondary):** In cases where timestamps are not available or equal, predefined source system hierarchy (e.g., IAM, Loyalty, Booking) will be applied.
- **Data Quality & Validation Rules:** Verified and standardized values will be preferred over incomplete or inconsistent data.
- **Manual Review (Fallback):** In cases of ambiguity, records will be routed to the Identity Resolution Utility for manual validation.

3. Deterministic Matching

The next stage applies deterministic matching rules using strong identity identifiers. Deterministic matching identifies records that can be confidently matched based on exact attribute comparisons.

Typical identifiers used include:

- phone number
- email address
- loyalty membership ID
- booking reference identifiers.

When strong identifiers match across systems, the records are automatically consolidated and linked to the same customer identity.

Example:

CIAM Record	Loyalty Record	Resolution
Phone: +91 9876543210	Phone: +91 9876543210	Auto Merge

Deterministic matching resolves the majority of identity matches with high confidence and minimal processing overhead

4. Logistic Regression Model

When deterministic matching cannot resolve the identity, the system evaluates records using a probabilistic matching model based on Logistic Regression.

Logistic Regression calculates the probability that two records represent the same individual by evaluating multiple identity attributes simultaneously.

Attributes used in the model may include:

- name similarity
- date of birth
- phone similarity
- email similarity
- city or location similarity.

Each attribute contributes to a weighted scoring model that generates an overall probability score.

Example:

Attribute	Match Indicator
Name similarity	0.85
DOB match	1
Phone similarity	0.9

The Logistic Regression model generates a probability score representing the likelihood of identity match.

5. Gradient Boosting Model

To enhance prediction accuracy, the solution incorporates a Gradient Boosting models. This model identifies complex relationships between identity attributes and improves the reliability of probabilistic matching.

Gradient Boosting is particularly effective in cases where:

- customer attributes contain inconsistencies
- multiple identifiers differ slightly across systems
- some identity attributes are missing.

By learning attribute interactions and correcting prediction errors, the Gradient Boosting model improves the overall accuracy of the identity matching process

6. Confidence Score Generation

The results from the probabilistic models are used to generate a final confidence score representing the likelihood that two records belong to the same customer.

The confidence score is evaluated against predefined thresholds to determine the appropriate resolution action.

Confidence Score	Resolution Action
≥ 0.85	Automatic merge
0.65 – 0.85	Sent for manual review
< 0.65	Treated as separate identities

These thresholds ensure that automated merging occurs only when there is a high level of confidence.

7. Auto Merge or Manual Review

Based on the confidence score, the system performs one of the following actions:

- **Automatic Merge:** Records with high confidence scores are automatically merged to create or update the unified **Golden Customer Profile**.
- **Manual Review:** Records with borderline confidence scores are routed to the Identity Resolution Utility, where authorized users can review records, compare attributes, and perform manual merge or split operations.

This controlled review process ensures data integrity while preventing incorrect automatic merges.

8. Identity Resolution Utility

The solution includes a web-based Identity Resolution Utility that allows authorized users to review and resolve identity conflicts when automated matching cannot determine identity with high confidence.

Key features include:

- duplicate identity detection dashboard
- side-by-side comparison of customer records
- record merge functionality
- record split functionality
- attribute-level selection for merge operations
- governance workflows for approval
- complete audit trail for identity changes.

This utility ensures data governance, transparency, and accurate identity reconciliation across systems.

9. Real-Time Identity Resolution (Optional Capability)

While the primary identity reconciliation process operates in batch mode, the solution supports real-time identity resolution through API services.

Real-time resolution enables customer identity matching during live interactions including:

- customer login
- booking processes
- loyalty account access
- personalized marketing interactions
- abandoned booking campaigns.

The identity resolution engine processes identity attributes in real time and returns the unified customer profile within sub-second latency thresholds

5.1.4. Identity Graph Layer

The Golden Customer Record represents the consolidated and authoritative identity profile of a customer after identity resolution has been performed across multiple source systems. It serves as the single trusted representation of a customer within the enterprise identity framework.

The creation of the Golden Customer Record is supported by the Master Customer Index (MCI), which maintains the mapping between the unified customer identity and the corresponding identifiers from source systems such as CIAM, Navitaire, BluChips, and other enterprise platforms.

The Master Customer Index performs the following functions:

- **Identity Mapping:** Maintains linkage between the Golden Customer ID and identifiers from different source systems.
- **Source Traceability:** Preserves the origin of identity attributes, enabling visibility into which system provided specific customer information.
- **Conflict Resolution:** Supports attribute-level prioritization rules when multiple systems contain differing values for the same customer attribute.
- **Identity Lifecycle Management:** Tracks updates, merges, and splits of identity records over time while maintaining historical traceability.

By maintaining a Golden Customer Record supported by the Master Customer Index, the platform ensures that all downstream applications reference a consistent and reliable customer identity, improving data accuracy, customer recognition across channels, and overall operational efficiency.

5.1.5. Customer 360 Profile Repository

The Customer 360 Profile Repository serves as the centralized data store for the unified customer identity generated by the Identity Resolution Engine. It maintains the Golden Customer Record, which represents the most accurate and consolidated representation of a customer across all enterprise systems.

The repository is populated after identity resolution processes such as deterministic matching, probabilistic matching, duplicate detection, and conflict resolution are completed. Once identities are resolved and validated, the platform generates a Golden Customer ID and stores the associated customer attributes within the repository.

The Customer 360 Profile contains consolidated information across multiple identity domains, including:

- **Identity Attributes:** Email, phone number, device identifiers, loyalty ID, and other unique identifiers.
- **Demographic Information:** Customer name, date of birth, gender, and address details.

The repository also maintains linkages between the Golden Customer ID and source system identifiers using the Master Customer Index, enabling traceability back to originating systems such as CIAM, Navitaire, BluChips, and EDH.

5.1.6. API & Service Layer

The API and Service Layer provides secure and standardized interfaces for integrating the Identity Resolution Platform with enterprise systems, applications, and digital channels.

This layer enables both inbound and outbound communication between the identity platform and connected systems such as booking engines, mobile applications, loyalty platforms, marketing systems, customer service platforms, and analytics environments

The API layer supports integration with:

- Booking engines
- Mobile applications
- Loyalty systems
- Marketing automation platforms
- Customer care systems
- Analytics platforms

These APIs are exposed through a secure API Gateway, enabling controlled access, authentication, throttling, and monitoring of service usage

5.1.7. Security & Governance Layer

The Security and Governance Layer ensures that the Identity Resolution Platform operates in compliance with enterprise security policies, data protection regulations, and governance standards.

Given the sensitive nature of customer identity data, the platform incorporates multiple security and governance mechanisms to protect data confidentiality, integrity, and availability.

Key components of this layer include:

- **Identity and Access Management:** Access to the platform and its services is controlled through role-based access mechanisms. Only authorized users and systems are permitted to access customer identity data or perform identity management operations.
- **Data Encryption:** Sensitive customer data is protected through encryption mechanisms applied both in transit and at rest, ensuring that identity attributes such as email addresses, phone numbers, and personal information remain secure.
- **Data Privacy and Compliance:** The platform incorporates privacy controls aligned with applicable data protection regulations. These controls ensure responsible handling of personally identifiable information (PII) and enforce policies related to data retention, masking, and access control.
- **Audit and Monitoring:** All identity resolution activities, including record merges, splits, manual reviews, and profile updates, are logged and monitored. Audit logs provide traceability for governance teams and enable compliance reporting.
- **Secure Infrastructure:** The platform is deployed within a secure cloud environment with capabilities such as network isolation, private endpoints, and secure credential management.

Governance Controls

The Identity Resolution Utility provides governance capabilities that allow authorized users to:

- review potential duplicate records
- approve or reject identity merges
- perform manual identity resolution
- track merge and split operations
- maintain audit trails for identity decisions

These governance controls ensure that identity resolution decisions remain transparent, traceable, and aligned with enterprise data governance standards.

5.1.8. Real-Time Monitoring and Reporting

The proposed Identity Resolution and Customer 360 platform incorporates a comprehensive 24x7 real-time monitoring and reporting framework to ensure high availability, performance, and operational reliability across all components.

The platform leverages enterprise-grade monitoring tools to continuously track system health, performance, and operational metrics across all layers including data ingestion, identity resolution engine, APIs, and data stores.

Key monitoring capabilities include:

- **Infrastructure Monitoring:** Continuous tracking of compute resources, containers, storage, and network components
- **Application Monitoring:** Monitoring of identity resolution services, APIs, and microservices for availability and performance
- **Data Pipeline Monitoring:** Tracking of batch and real-time data ingestion pipelines, including job status, throughput, and failures
- **API Monitoring:** Real-time tracking of API response times, request volumes, error rates, and latency
- **Identity Processing Monitoring:** Monitoring of identity matching processes, scoring performance, and processing timelines

Monitoring will be enabled using tools such as Azure Monitor and Log Analytics, providing centralized visibility into system operations.

- **Alerting and Incident Management:** The platform includes proactive alerting mechanisms to ensure timely identification and resolution of issues:
 - Automated alerts for system failures, performance degradation, and threshold breaches
 - Configurable alert thresholds based on critical system metrics
 - Integration with incident management workflows for rapid response
 - Support for escalation to L2/L3 teams based on severity levels

This ensures minimal downtime and rapid incident resolution.

- **Out-of-the-Box Reporting and Dashboards:** The solution provides built-in reporting capabilities to track output of the solutions to show below KPIs.

KPI	Description	Measurement Method
Identity Match Accuracy (%)	Measures correctness of matched customer identities across systems	$(\text{Correct Matches} / \text{Total Matches}) \times 100$
Duplicate Record Reduction (%)	Tracks reduction in duplicate customer profiles post-implementation	$((\text{Duplicates Before} - \text{After}) / \text{Before}) \times 100$
Real-Time Resolution Latency (ms)	Time taken to resolve identity during live interactions (API response time)	Average API response time
Confidence Score Distribution (%)	Distribution of identity matches across auto-merge, manual review, and rejection categories	% split across confidence thresholds
SLA Compliance Rate (%)	Percentage of incidents/tickets resolved within defined SLA timelines	$(\text{Resolved within SLA} / \text{Total Tickets}) \times 100$

These reports enable stakeholders to continuously monitor system performance and make informed operational decisions.

5.1.9. User Training

Lagozon will provide comprehensive user training and knowledge transfer as part of the implementation to ensure that IndiGo's business and technical teams are able to effectively operate, manage, and utilize the Identity Resolution and Customer 360 Platform.

- **Training Approach:** The training program will be structured to cover both functional and technical aspects of the solution, tailored to different user groups:
 - **Business Users:** Focus on understanding Customer 360 profiles, identity resolution outcomes, and usage of the Identity Resolution Utility (manual review, merge/split operations).
 - **Technical Teams:** Focus on system architecture, data flows, APIs, monitoring tools, and operational support procedures.
 - **Support Teams (L1/L2):** Training on incident handling, ticket triaging, and operational workflows.
- **Training sessions will be delivered through a combination of:**
 - Instructor-led workshops
 - Hands-on demonstrations
 - Scenario-based walkthroughs
 - Interactive Q&A sessions
- **Documentation and Training Materials:** Lagozon will provide comprehensive documentation to support ongoing learning and system usage, including:
 - User manuals and quick reference guides
 - Technical and operational documentation

- API documentation
- Troubleshooting and FAQ guides
- All training materials will be shared with IndiGo teams for future reference.
- **Training Outcomes:** The training program will ensure that IndiGo teams are:
 - Capable of independently operating and managing the platform
 - Equipped to perform identity review and governance activities
 - Prepared to handle first-level support and issue triaging
 - Able to leverage Customer 360 insights effectively

6. System Architecture & Security Framework

The proposed architecture follows a modular microservices-based design aligned with IndiGo's enterprise architecture principles, enabling scalability, flexibility, and seamless integration with existing systems. The solution will follow a **services-based and modular architecture approach**, in line with IndiGo's expectation for a scalable integration framework and microservice-based implementation.

The Indigo B2C Identity Resolution Platform is designed to unify customer identities across multiple enterprise systems by consolidating fragmented customer records into a single Golden Customer Profile.

The platform leverages a combination of data standardization, deterministic matching, probabilistic matching, and AI/ML-based similarity models to identify and merge duplicate customer identities with high accuracy.

Built on Microsoft Azure cloud-native services, the architecture supports both real-time and batch processing, enabling scalable, secure, and compliant identity resolution for enterprise customer data.

The platform ensures that downstream systems such as CRM, booking platforms, loyalty systems, and analytics applications operate on a consistent and trusted customer identity foundation.

Architecture Component	Azure Service	Description
Data Ingestion APIs	Azure API Management	Provides secure API gateway for ingesting identity data from enterprise systems and external platforms.
Real-Time Event Streaming	Azure Event Hubs	Enables high-throughput real-time ingestion of identity events such as bookings, login activity, and transactions.
Streaming Pipeline Processing	Azure Stream Analytics	Processes streaming identity signals and prepares them for real-time identity resolution.
Batch Data Integration	Azure Data Factory	Orchestrates batch ETL pipelines for ingesting historical and scheduled identity datasets from enterprise systems.
Identity Resolution Microservices	Azure Kubernetes Service	Hosts containerized microservices responsible for deterministic matching, probabilistic matching, and identity resolution workflows.
AI/ML Matching Models	Azure Machine Learning	Develops and deploys machine learning models for similarity scoring, probabilistic matching, and identity prediction.
Golden Customer Profile Store	Azure Cosmos DB	Stores unified customer profiles and Golden IDs with low latency and global scalability.
Rules & Configuration Store	Azure SQL Database	Stores deterministic matching rules, scoring thresholds, and configuration parameters.
High-Speed Lookup Cache	Azure Cache for Redis	Provides fast lookup of identity mappings and previously resolved records to improve matching performance.
Manual Review Portal	Azure App Service	Hosts the web-based interface for manual identity review, merge approval, and governance workflows.
Workflow Orchestration	Azure Logic Apps	Automates identity resolution workflows such as manual review routing and merge approvals.
Monitoring & Observability	Azure Monitor	Provides system monitoring, performance metrics, and operational insights.
Centralized Logging	Azure Log Analytics	Stores and analyzes platform logs for troubleshooting and auditing.
Secrets & Key Management	Azure Key Vault	Secures credentials, API keys, encryption keys, and sensitive configuration.
DevOps CI/CD Pipeline	Azure DevOps	Enables continuous integration and continuous deployment pipelines for platform updates.
Code Repository	GitHub	Provides version control and source code management.
Network Security	Azure Private Link	Enables secure private connectivity between services without exposing endpoints to the public internet.
Data Privacy & Compliance	Microsoft Purview	Supports data governance, data lineage tracking, and compliance with privacy regulations.

Identity Resolution utility / Review Portal	Front End: React.js Authentication: MS Entra ID – SSO Authorisation: RBAC Back End: .Net API Security: OAuth2.0 Integrations: REST API Data Protection: HTTPS, TLS	The Identity Review Portal will be built using a React-based frontend integrated with Microsoft Entra ID for secure SSO authentication, and a .NET Core API layer for business logic and data access, ensuring a scalable, secure, and enterprise-grade review and governance platform.s
---	--	--

6.1. Disaster Recovery & High Availability

The Identity Resolution and Customer 360 Platform is designed with a resilient, fault-tolerant, and highly available architecture to ensure continuous system availability, data protection, and business continuity. The solution follows a multi-layered high availability and disaster recovery strategy, ensuring there is no single point of failure across application, data, and integration layers.

6.2. High Availability Architecture

The platform is built using Azure cloud-native services to ensure high availability across all components:

- **Application Layer**
 - Microservices are deployed on Azure Kubernetes Service (AKS) across multiple availability zones
 - Auto-scaling (Horizontal Pod Autoscaler) ensures dynamic scaling based on load
 - Self-healing capabilities automatically restart failed containers
 - Load balancing via Azure Application Gateway ensures even traffic distribution
- **Integration Layer**
 - Azure API Management provides secure and scalable API exposure
 - Azure Event Hubs ensures fault-tolerant, high-throughput event ingestion
- **Data Layer**
 - Azure Cosmos DB is configured with multi-region replication and automatic failover
 - Azure SQL Database uses active geo-replication
 - Azure Cache for Redis is deployed in clustered mode with replica nodes

6.3. Disaster Recovery Strategy

The platform follows a region-level disaster recovery strategy to handle large-scale failures such as regional outages.

DR Design Approach

- Primary region (Active)
- Secondary region (Failover / Warm Standby)

Component-Level DR Strategy

Component	DR Approach
AKS	Secondary region deployment with failover readiness
Cosmos DB	Multi-region replication with automatic failover
Azure SQL	Active geo-replication
Event Hubs	Geo-disaster recovery pairing
Storage	Geo-redundant storage (GRS)

6.4. Failover Mechanism

The platform supports both automatic and orchestrated failover mechanisms:

- Automatic failover for:
 - Cosmos DB
 - Azure SQL Database
- Orchestrated failover for:
 - Application services (AKS)
 - API layer

Failover Process

1. Failure detection via Azure Monitor alerts
2. Traffic rerouting using Azure Traffic Manager / DNS
3. Activation of secondary region services
4. Validation of system health and service continuity

6.5. Backup and Data Protection

The solution incorporates robust backup and recovery mechanisms

Component	Backup Strategy
Cosmos DB	Continuous backup
Azure SQL	Automated backups with Point-in-Time Restore (PITR)
Configuration	Version-controlled via Azure DevOps / GitHub
Logs	Centralized logging in Log Analytics

6.6. Recovery Objectives

The platform is designed to meet enterprise-grade recovery targets:

- Recovery Time Objective (RTO): ≤ 2 hours
- Recovery Point Objective (RPO): ≤ 15 minutes
- Availability SLA: $\geq 99.9\%$ uptime

6.7. Monitoring and Automated Recovery

The platform leverages Azure Monitor and Log Analytics for real-time monitoring and automated recovery:

- Continuous health monitoring across all services
- Automated alerts for failures and performance degradation
- Auto-restart and retry mechanisms for failed services
- Integration with incident management workflows

This ensures rapid detection and resolution of failures with minimal downtime

6.8. Network and Security Resilience

- All services are deployed within Virtual Network (VNet) boundaries
- Azure Private Link ensures secure service communication
- No exposure of critical services to the public internet
- Secure failover ensures data protection during DR events

6.9. Disaster Recovery Testing and Validation

To ensure readiness and compliance, the following DR practices will be implemented:

- Quarterly Disaster Recovery drills
- Failover simulation testing
- Backup restoration validation
- Performance validation under DR scenarios

Deliverables include:

- DR Test Reports
- Failover Validation Reports
- Compliance and audit documentation

6.10. Zero Downtime Deployment (High Availability Enhancement)

The platform supports zero-downtime deployments using:

- Blue-Green deployment strategy
- Canary releases for controlled rollout
- Automated rollback mechanisms

7. High Level Plan and Implementation Approach

Lagozon proposes a structured and phased implementation approach to ensure the successful design, development, and deployment of the Customer Identity Resolution framework for IndiGo. The implementation will follow a controlled project lifecycle that enables close collaboration with IndiGo's technology teams, ensures alignment with existing system architectures, and allows iterative validation during development.

The approach focuses on delivering a reliable identity resolution capability while minimizing operational disruption and ensuring that the solution meets IndiGo's performance, security, and integration requirements.

High Level Plan and Phases

Phase	M1	M2	M3	M4	M5	M6	M7	M8	Year 1
Discovery Phase	3 Weeks								
Solution Design	2 Weeks								
Development		12 Weeks							
SIT					2 Weeks				
UAT						2 Weeks			
Go-Live						1 Week			
Documentation						2 Weeks			
Hypercare							8 Weeks		
L2/L3 Support									12 months

The implementation will broadly consist of the following phases:

Phase	Key Activities	Key Deliverables
Discovery Phase	Conduct stakeholder workshops, analyze current systems (IAM, Navitaire, Loyalty, EDH), assess duplicate identities, analyze data flows, identify deterministic identifiers (email, phone), document identity resolution use cases	BRD, Data Flow Diagrams (DFD), Software Requirement Specification (SRS), Requirements Traceability Matrix (RTM)
Solution Design	Define solution architecture, design identity resolution engine, define deterministic and probabilistic matching rules, design data standardization framework, define integration architecture, security and infrastructure design	High Level Design (HLD), Low Level Design (LLD), Architecture Documents (Application, Data, Security, Network, Integration)
Development	Develop microservices-based identity resolution engine, build data ingestion pipelines, implement deterministic and probabilistic matching, develop AI/ML scoring models, implement	Application source code, microservices components, integration services, identity matching algorithms, deployment scripts

	customer 360 profile services, develop review portal and APIs	
System Integration Testing (SIT)	Execute integration testing across systems, validate APIs, test deterministic and probabilistic matching logic, validate data synchronization, execute regression testing	Test Strategy, Test Plan, Test Case Specification, Test Logs, Defect Reports
User Acceptance Testing (UAT)	Conduct business validation with IndiGo stakeholders, validate identity resolution accuracy, test workflows and review portal, capture feedback and implement fixes	UAT Test Cases, Test Data, User Acceptance Report, Signed UAT Approval
Go-Live	Deploy platform to production, migrate and reconcile identity data, perform production validation, security certification, performance testing, DR validation	Production Deployment Report, Security Certification, Performance Test Report, Go-Live Sign-Off
Documentation	Prepare technical and operational documentation, create API documentation, develop training materials and user manuals	Installation Guide, Operations Manual, Administrator Guide, User Manuals, Training Materials
Hypercare	Monitor production environment, resolve post-go-live issues, optimize identity matching performance, stabilize platform and provide operational support	Incident Reports, Performance Monitoring Reports, Knowledge Base Articles
L2/L3 Support	Production monitoring, bug fixes, change requests, incident resolution, performance optimization, quarterly ticket analysis and continuous improvement	SLA Reports, RCA Reports, Change Management Documentation, Ticket Analysis Reports

Note: Lagozon may not deliver each document individually and may instead consolidate them based on logical groupings, while ensuring that all key aspects are comprehensively covered.

8. Key Risks & Mitigation Strategy

Implementing an identity resolution framework across multiple operational systems requires careful consideration of potential technical and operational risks. Lagozon follows a structured risk management approach that identifies potential challenges early and implements mitigation strategies to ensure smooth project execution.

The following table outlines key risks that may arise during the implementation and the mitigation measures that will be adopted to address them.

Risk Area	Description	Mitigation Strategy
Data Inconsistency Across Systems	Customer identity attributes across Navitaire, BluChips, and CIAM may contain inconsistencies such as varying phone number formats, incomplete profiles, or conflicting identity attributes.	Implement structured data normalization and standardization processes prior to identity matching. Use deterministic and probabilistic matching techniques with defined confidence thresholds to ensure reliable identity resolution.
Wrong Record Merge	Records belonging to different customers may be incorrectly merged due to similar or incomplete identity attributes, resulting in inaccurate Customer 360 profiles and potential downstream data inconsistencies	Use a combination of deterministic and probabilistic matching with defined confidence thresholds. Only high-confidence matches are auto-merged, while uncertain matches are routed for manual review through the Identity Resolution Utility. All merge actions will be logged with audit trails and rollback capability
Poor Test Data Quality	If test datasets do not represent real-world identity scenarios (duplicates, partial matches, cross-system records), the identity resolution engine may not be fully validated	Use representative test datasets and iterative model tuning with validation datasets.
Third-Party System API Limitations	Integration with systems such as Navitaire or loyalty platforms may be constrained by API limits, authentication requirements, or data access restrictions	Perform early API validation and use asynchronous ingestion where required
ML Model Bias / Incorrect Predictions	Machine learning models may generate inaccurate identity match predictions if training datasets are limited or biased	Use hybrid deterministic + ML approach and periodically retrain models using validated datasets
Duplicate Identity Records	Existing systems may contain multiple records representing	Apply multi-stage identity matching logic combining deterministic rules and

	the same customer, which may complicate identity reconciliation.	probabilistic scoring, supported by validation thresholds to minimize incorrect merges.
System Integration Dependencies	Integration with enterprise systems such as Navitaire, BluChips, and CIAM may require coordination with internal system owners and APIs.	Conduct early integration planning and interface validation, and work closely with IndiGo's technical teams to ensure secure and reliable system connectivity.
Data Security & Privacy Considerations	Customer identity data contains sensitive information that must be handled securely and in compliance with organizational policies and regulatory expectations.	Follow enterprise security practices, including encryption, access controls, audit logging, and secure interface-based access to customer data.
Performance & Scalability Requirements	Identity resolution processes must handle large volumes of customer records without affecting operational system performance.	Design the framework using scalable architecture and optimized processing mechanisms to support high-volume identity comparisons and ongoing synchronization.
Operational Adoption & Validation	Identity resolution outcomes may require validation by business or data governance teams to ensure accuracy and trust in the results.	Provide transparent matching logic, confidence scoring, and traceability of identity resolution decisions to support operational validation and governance.

9. Assumptions & Dependencies

The following assumptions are based on the current understanding of the IndiGo B2C Identity Resolution initiative, requirements shared in the RFP, and discussions with the IndiGo team. These assumptions form the basis for the proposed implementation timeline, scope, and cost.

Any deviation from these assumptions may result in adjustments to the project scope, delivery timeline, or commercial terms and will be addressed through a formal Change Management Process.

1. Scope Understanding and Requirement Changes

- The proposed solution and implementation plan are based on the requirements defined in the RFP and subsequent discussions with IndiGo stakeholders.
- Any change in scope, additional requirements, or modification of functionality after the approval of the Software Requirement Specification (SRS) will be handled through a formal Change Request process.
- Changes in scope may impact timeline, effort, and cost, and will be evaluated jointly by IndiGo and the vendor.

2. Project Timeline and Scheduling

- The project implementation will follow the phased timeline defined in the implementation plan (Discovery, Design, Development, SIT, UAT, Go-Live).
- Any delay in approvals, access provisioning, infrastructure readiness, or data availability may impact the implementation timeline.

3. Identity Resolution Accuracy Limitation

- The accuracy of the identity resolution outcomes is dependent on the quality, completeness, and consistency of data available across source systems, as well as the defined matching rules and model configurations.
- While the solution is designed to achieve high accuracy through a combination of deterministic and probabilistic matching techniques, it cannot guarantee 100% accuracy in all scenarios, particularly in cases of incomplete, inconsistent, or conflicting identity attributes.
- The platform will provide confidence-based matching, manual review workflows, and audit capabilities to minimize the risk of incorrect merges. Final validation, approval of merge decisions (where applicable), and ongoing governance of identity data will remain the responsibility of IndiGo.

4. Infrastructure and Environment Availability

- IndiGo will provide all necessary cloud infrastructure, network access, and security configurations required for the deployment of the Identity Resolution platform.
- The following environments will be provisioned by IndiGo before development begins:
 - Development Environment
 - UAT / Testing / SIT Environment
 - Production Environment
- Infrastructure will be configured and operational before development and testing activities begin.

5. Security Assessment and Compliance Responsibility

- Platform-level security assessments, including but not limited to VPAT, VAPT, regulatory compliance audits, and enterprise security certifications, shall be the responsibility of IndiGo or its designated security partners.
- Lagozon will support remediation by addressing application-level vulnerabilities and observations identified through such assessments, based on the findings shared by IndiGo.
- Any remediation efforts requiring additional tools, licenses, infrastructure changes, or incremental manpower beyond the agreed project scope—particularly post go-live—will be undertaken upon mutual agreement and approval of associated commercials through a formal change request process.

6. System Access and Integration Readiness

- IndiGo will provide timely access to all relevant systems and APIs including but not limited to:
 - IAM (Microsoft Entra ID)
 - Navitaire booking system
 - Loyalty system
 - Enterprise Data Hub (EDH)
- API documentation, data schemas, and authentication mechanisms will be shared prior to integration development.

7. Data Availability

- IndiGo will provide required customer identity datasets and sample data for development, testing, and validation.
- Test data must represent realistic customer scenarios including:
 - duplicate identities
 - cross-system identities
 - incomplete data cases
- Any delays in data availability may affect project timelines.

8. Data Quality Responsibility

- The Lagozon will implement data standardization and identity matching mechanisms within the identity resolution platform.
- Data quality, completeness, and consistency of source systems remain the responsibility of IndiGo. The identity resolution platform will not perform large-scale data cleansing beyond defined normalization and matching logic.
- Any significant data inconsistencies that require structural changes in source systems will be handled by the respective system owners.

9. Identity Matching Rules

- Deterministic matching rules will be defined collaboratively between IndiGo and the implementation partner based on:
 - Email ID
 - Phone Number
 - Loyalty ID
 - Other available identifiers.
- Probabilistic matching rules and scoring thresholds will be validated with IndiGo during the testing phase.

10. Real-Time vs Batch Dependency: In case, IndiGo wishes to do real time solution, Real-time identity resolution will depend on availability, performance, and response constraints of upstream systems. In case of limitations, real-time processing will operate on cached or previously synchronized data.

11. Integration Dependencies

- The identity resolution platform will integrate with multiple enterprise systems.
- Any required changes to existing source systems, APIs, or data models will be managed by IndiGo or the respective system vendors.
- The implementation partner will consume available APIs and interfaces but will not modify source systems.

12. Test Data and Testing Support

- IndiGo will provide:
 - Adequate test datasets
 - Access to test environments
 - Participation of relevant stakeholders during testing cycles.
- Adequate and representative test data will be provided by IndiGo to support the validation of the Identity Resolution Engine. The test dataset should include realistic scenarios such as duplicate records, partial matches, and cross-system identities to enable accurate testing and tuning of deterministic and probabilistic matching logic. Insufficient or non-representative test data may impact the ability to validate and optimize the accuracy of the identity resolution outcomes.
- Delays in providing test data or environment access may affect the planned testing schedule.

13. User Acceptance Testing (UAT)

- UAT will be conducted with participation from designated IndiGo business and technical stakeholders.
- Feedback or approval for UAT deliverables will be provided within 7 business days of submission.
- Delays in feedback may impact the project schedule.

14. Security and Compliance

- The identity resolution platform will comply with IndiGo's information security policies and compliance requirements.
- Security reviews and certifications will be performed in coordination with the IndiGo IT Security team.

15. Third-Party Systems

- The solution will integrate with existing third-party systems such as:
 - IAM
 - Navitaire
 - Loyalty platforms
 - EDH
- The implementation partner will not be responsible for the performance, availability, or maintenance of third-party systems.

16. Resource Availability

- IndiGo will allocate appropriate business and technical stakeholders for:
 - Requirement workshops
 - Design validations

- UAT testing
- Go-live readiness reviews.

Active participation from these stakeholders is necessary to maintain the project timeline.

17. Project Governance

- A joint governance structure will be established including:
 - Steering Committee
 - Project Management Office (PMO)
 - Technical Working Groups
- Regular status meetings and progress reviews will be conducted.

18. Confidentiality and Data Protection

- Both IndiGo and the implementation partner will ensure that all shared information, data, and project artifacts are handled in accordance with confidentiality and data protection policies.
- Customer data will be protected through encryption, access control, and audit logging mechanisms.

19. Solution Limitation: Any requirement that cannot be implemented due to inherent limitations of the technology stack, platform capabilities, architectural constraints, or logical feasibility based on available data and system interfaces will be considered out of scope for the project and may require alternative approaches or change requests.

20. Scope Exclusions: The following items are considered out of scope unless explicitly agreed upon:

1. Modifications to existing source systems such as Navitaire, IAM, or Loyalty platforms.
2. Data cleansing activities within source systems.
3. Development of unrelated marketing or campaign management tools.
4. Changes to third-party applications or vendor-managed platforms.
5. Custom development outside the scope of identity resolution and customer 360 capabilities.

10. Performance KPIs

S. No.	KPI	Criteria	Response
1	Feature Lead Time & Deployment Frequency	Measures time from feature request to release.	The platform will adopt Agile development supported by CI/CD pipelines using Azure DevOps and GitHub. Feature lead time will typically align with 2–4 week sprint cycles, allowing incremental delivery of functionality. Deployment frequency will follow regular sprint-based releases, with automated build, testing, and deployment pipelines enabling controlled and repeatable releases to staging and production environments.
		Describe how often new code is released.	
		High frequency implies agility and CI/CD maturity	
2	Change Failure Rate and Mean Time to Recovery (MTTR)	Percentage of deployments that fail and require fixes.	The solution will implement automated testing, code reviews, and staged deployments to minimize change failure rates. Based on DevOps best practices, the target change failure rate will be below 5%. Continuous monitoring, alerting, and rollback mechanisms will support rapid incident resolution with an expected Mean Time to Recovery (MTTR) of less than 1 hour for critical services.
		Time taken to fix issues in production.	
3	Defect Density and Automated Test Coverage	Number of defects per unit of code.	The development lifecycle will incorporate automated unit testing, integration testing, and regression testing within CI/CD pipelines. Automated test coverage will target 70–80% coverage for critical platform components, ensuring early defect detection and maintaining low defect density throughout the software lifecycle.
		Percentage of code covered by automated tests.	

4	Security Vulnerabilities	Tracks known vulnerabilities and patching speed.	The IndiGo Security Team will provide security assessment findings and identified vulnerabilities. Lagozon will be responsible for implementing the required mitigation measures in alignment with IndiGo's security guidelines and timelines. In cases where remediation requires additional licenses, tools, or incremental manpower beyond the agreed scope, Lagozon will submit a detailed proposal outlining the effort and associated costs for IndiGo's review and approval prior to implementation.
---	---------------------------------	--	---

11. Project Management and Quality Assurance

The Project Management Framework for this engagement will follow an Agile delivery methodology, enabling iterative development, adaptive planning, and continuous collaboration between Lagozon Technologies and IndiGo.

The Agile approach ensures that the solution evolves based on feedback from IndiGo stakeholders during development, enabling faster validation of identity resolution capabilities and alignment with evolving business and technical requirements.

The implementation will follow a controlled Agile delivery model aligned with the project phases defined in the RFP, ensuring governance, traceability, and transparency throughout the project lifecycle.

11.1. Sprints and Iterative Development

The implementation will be structured into iterative development sprints, typically lasting 2–4 weeks, allowing the delivery team to incrementally develop, test, and validate components of the Identity Resolution platform.

The team will focus on delivering functional components at the end of each sprint, ensuring that progress is visible and measurable.

- **Sprint Planning:** Each sprint begins with a planning session, where tasks are prioritized, and the sprint's goals are set.
- **Sprint Execution:** During the sprint, the Lagozon team will focus on developing and delivering the agreed-upon solution components, which may include identity data ingestion pipelines, data standardization services, identity matching algorithms, Customer 360 profile services, API integrations, and identity resolution workflows.
- **Sprint Review and Demo:** At the end of each sprint, a review and demo will be conducted to showcase the completed work to Indigo. Feedback will be gathered and incorporated into future sprints.
- **Sprint Retrospective:** The team will conduct a retrospective at the end of each sprint to review what went well, identify areas of improvement, and adjust the process for subsequent sprints.

11.2. Agile Roles and Responsibilities

The **Agile framework** clearly defines roles to ensure efficient collaboration and accountability:

Role	Responsibility
Product Owner (IndiGo Representative)	Represents business stakeholders and defines solution priorities. Responsible for validating sprint deliverables and ensuring alignment with business objectives.
Scrum Master (Lagozon Representative)	Facilitates Agile ceremonies, removes delivery blockers, and ensures adherence to Agile practices and project timelines.
Solution Architect (Lagozon)	Responsible for overall system architecture, integration design, and alignment with IndiGo enterprise architecture guidelines.
Development Team (Lagozon)	Consists of data engineers, platform engineers, and testing specialists responsible for development, integration, and validation of the identity resolution platform.
IndiGo Technical Stakeholders	Provide system access, technical validation, and integration support across Navitaire, CIAM, and other enterprise platforms.

11.3. Process Compliance Audits

Lagozon maintains a strong focus on quality through an **independent Quality Assurance (QA) framework**.

The QA function operates independently from the delivery team and ensures adherence to project standards through:

- Process compliance audits
- Release verification checks
- Work product quality reviews
- Code quality assessments
- Final inspection and validation before production deployment.

This structured quality framework ensures that the solution delivered to IndiGo meets **enterprise-grade reliability, security, and performance standards**

11.4. Communication Plan

Effective communication and governance are critical to the success of the project. Lagozon will implement a structured **project monitoring and governance framework** to ensure transparency in project execution.

The Project Manager will regularly communicate project status, risks, progress, and key milestones using structured reporting mechanisms.

Tracking and monitoring will occur across the following levels:

- Ongoing project monitoring
- Weekly delivery tracking
- Monthly governance review
- Milestone-based reporting.

A **Steering Committee** will be established to provide strategic oversight for the engagement. The committee will consist of senior leadership representatives from IndiGo and Lagozon and will be responsible for major project decisions, escalation handling, and alignment with strategic objectives.

Meeting Type	Frequency	Purpose	Attendees
Project Kick-Off Meeting	Once (Project Start)	Confirm project objectives, scope, governance structure, and stakeholder roles.	Lagozon: Engagement Director, Project Manager, Solution Architect IndiGo: IT Leadership, Data Team, Business Stakeholders
Daily Scrum Meeting	Daily	Review the user stories, bottlenecks and parking lot.	Lagozon: Project Team Indigo: Project Team
Weekly Project Status Meeting	Weekly	Review project progress, discuss delivery updates, address issues, and plan upcoming activities.	Lagozon: Project Manager, Delivery Leads IndiGo: Technical SPOC
Sprint Review / Demonstration	End of each Sprint	Demonstrate completed sprint deliverables and gather feedback from stakeholders.	Lagozon: Delivery Team, Solution Architect IndiGo: Product Owner, Technical Team
Steering Committee Meeting	Monthly	Review overall progress, address escalations, and ensure alignment with business objectives.	Lagozon: Engagement Director, Program Manager IndiGo: IT Leadership, Business Stakeholders

11.5. Governance framework

12. Warranty Support

As part of our commitment to ensuring the successful implementation of the Customer 360 and Identity Resolution Platform for IndiGo, Lagozon Technologies will provide comprehensive post-deployment warranty support.

The warranty support period ensures that the deployed platform operates as expected in the production environment and provides IndiGo with adequate technical assistance during the initial stabilization phase following go-live.

This support ensures that any issues related to the implemented solution are addressed promptly, allowing IndiGo to fully adopt and operationalize the platform across its digital ecosystem.

1. Duration of Warranty Support

Lagozon Technologies will provide 60 days of warranty support following the successful deployment and go-live of the Identity Resolution Platform and Customer 360 solution.

The warranty period will commence after formal go-live sign-off by IndiGo and will ensure that the system is stabilized and functioning as per the agreed project scope and requirements.

2. Warranty Support Coverage Details

During the warranty period, Lagozon Technologies will provide the following support services:

Bug Fixes and Defect Resolution: Lagozon will investigate and resolve any defects identified in the delivered solution that fall within the scope of the originally agreed requirements. This includes issues related to:

- Identity resolution logic
- deterministic and probabilistic matching rules
- Customer 360 profile generation
- identity merge and split functionality
- integration pipelines and APIs
- data standardization services
- identity resolution utility functionality.

Technical Support: Technical assistance will be provided to IndiGo's technical and operational teams to support the smooth functioning of the platform. This may include:

- troubleshooting system issues
- assisting with platform configuration
- resolving operational errors
- providing guidance on platform usage and workflows.

Platform Stabilization Support: The Lagozon delivery team will support IndiGo during the stabilization period to ensure the platform operates effectively in the production environment. This includes monitoring system behavior, addressing configuration issues, and ensuring identity resolution workflows operate as expected.

3. Exclusions from Warranty Support

The following activities will not be covered under the warranty support period:

- a) **Changes in Scope or Requirements:** Any changes, enhancements, or additional requirements beyond the originally approved project scope will not be covered under warranty. Such requests will be managed through the Change Request (CR) process and may involve additional cost and timeline adjustments.
- b) **Third-Party System Issues:** Any issues arising from third-party systems or external platforms such as CIAM, Navitaire, loyalty systems, or other enterprise systems that are not managed by Lagozon will fall outside the warranty scope.
- c) **Major Enhancements:** Requests for significant enhancements, new features, or major architectural changes to the platform will not be included in the warranty scope and will require a separate agreement or CR approval.
- d) **User-Induced Issues:** Issues resulting from incorrect system usage, unauthorized configuration changes, or data corruption caused by manual intervention will not be covered under warranty support.
- e) **Cloud Infrastructure and Security Management:** IndiGo will be responsible for managing the underlying cloud infrastructure, network configuration, and security controls associated with the platform. Any infrastructure-related issues will be handled by IndiGo's internal teams or cloud service providers.

13. SLA

Based on the RFP, the solution will be considered as a critical application and will be governed by standard SLAs of IndiGo.

The following assumptions and dependencies are defined in alignment with the RFP requirement where Level 1 (L1) support is managed by IndiGo and Level 2/Level 3 (L2/L3) support is provided by Lagozon.

1. Support Model and SLA Applicability

- The SLA will become effective three months after the start of the Annual Support period.
- SLAs will be applicable only for incidents that are logged, categorized, and assigned by the L1 Support team (IndiGo) to Lagozon (L2/L3).
- SLA timelines will be measured from the time the ticket is assigned to L2/L3 in the ticketing system.

2. Ticketing Tool and Access

- IndiGo will provide access to its ITSM / ticketing tool for incident tracking, updates, and closure.
- Necessary training and onboarding will be provided to the Lagozon support team for effective usage of the tool.
- All communication, updates, and status tracking will be maintained within the designated ticketing system.

3. Incident Logging and Information Availability

- All incidents must be logged by L1 with complete and accurate details, including:
 - issue description
 - impacted systems
 - logs/screenshots
 - severity classification
- Incomplete or incorrect information may impact resolution timelines and SLA adherence.

4. Severity Classification

- Incident severity levels will be defined and agreed mutually.
- Initial severity classification will be performed by IndiGo L1 team, with validation by Lagozon if required.
- Any reclassification of severity will be mutually agreed.

5. Dependency on IndiGo Teams

- Resolution timelines may depend on:
 - availability of IndiGo SMEs/business users
 - access to systems and environments
 - required approvals or clarifications
- Any delays due to dependency on IndiGo teams will be excluded from SLA calculations.

6. Third-Party System Dependencies

- Issues related to third-party systems such as:
 - Navitaire
 - CIAM (Azure Entra)
 - Loyalty systems
 - Cloud infrastructurewill be coordinated by Lagozon but resolution will depend on respective system owners/vendors.
- Such dependencies will be tracked but excluded from SLA commitments.

7. Environment and Access Availability

- IndiGo will provide necessary access to:
 - production and non-production environments
 - logs and monitoring tools
 - APIs and integration endpoints
- Any delay in access provisioning may impact resolution timelines.

8. Support Coverage Window

- Support services will be provided during agreed business hours only.
- Severity 0 tickets may require extended support, subject to mutual agreement. Lagozon will make best efforts to address tickets logged outside business hours.

9. Exclusions from Support Scope: The following will not be covered under L2/L3 support SLA:

- Major enhancements or new feature development
- Changes in business logic or matching rules beyond minor tuning
- Data issues originating from source systems
- Infrastructure-level issues (unless explicitly in scope)
- User training or repeated operational queries (handled by L1)

10. Change Requests (CR) Handling

- Any requirement outside standard support scope will be handled through the Change Request (CR) process.
- CRs may impact cost, timelines, and resource allocation.

11. Knowledge Transition Dependency

- A structured knowledge transfer and transition from implementation to support team will be completed before the start of L2/L3 support.
- Required documentation and system walkthroughs will be provided during this phase.

12. SLA Measurement and Reporting

- SLA performance will be tracked through:
 - response time
 - resolution time
 - incident volume and trends
- Periodic reports will be shared with IndiGo including:
 - SLA adherence
 - incident summary
 - root cause analysis (RCA)

Availability SLAs:

- IndiGo has shared its standard SLAs along with applicable penalties for any breaches.
- Lagozon proposes minor adjustments to certain SLAs based on the solution design.
- The final SLAs and associated penalties will be mutually agreed upon during contract finalization discussions. Penalty clauses shall become applicable only after the solution has stabilized post the warranty/support period, ensuring that performance is measured under steady-state conditions. Penalties will be applicable only to the cost of support services.

14. New Change Requests (CR) Development and Customizations

Following the completion of the implementation phase, IndiGo may require enhancements or additional capabilities to extend the functionality of the Identity Resolution Platform. Such requests will be managed through a structured **Change Request (CR) process**.

14.1. Scope of Change Requests:

Change requests may include enhancements or new developments such as:

- Extending the identity resolution framework to integrate additional enterprise systems or customer data sources.
- Developing new APIs or services to support additional digital channels or applications.
- Enhancing identity matching rules, scoring models, or data standardization logic.
- Integrating new identity attributes or identifiers to improve identity matching accuracy.
- Expanding the Customer 360 data model to include additional customer attributes or behavioural data.
- Enhancing the Identity Resolution Utility with new features such as improved duplicate review workflows or governance capabilities.
- Integrating additional analytics capabilities or reporting for identity resolution insights.
- Modifying data ingestion pipelines to accommodate changes in upstream data structures or new integration requirements.
- Enhancing performance, scalability, or monitoring capabilities of the identity resolution platform.

14.2. Process for New CR Development and Approval

Step	Process	Description
1	Change Request Submission	IndiGo team submits a detailed Change Request using a standardized template describing the requested enhancement or modification.
2	Initial Assessment & Feasibility Analysis	Lagozon reviews the request, clarifies requirements, evaluates technical feasibility, and provides a preliminary effort, timeline, and cost estimate.
3	IndiGo Approval	Lagozon presents the feasibility assessment and estimate to IndiGo for review and approval.
4	Detailed Planning	Upon approval, Lagozon prepares a detailed project plan including implementation approach, effort estimation, and resource allocation.
5	Development & Implementation	Development resources are assigned to implement the requested changes. Appropriate testing activities such as unit testing, integration testing, and validation are performed.
6	Customer Review & Feedback	The completed solution is presented to IndiGo stakeholders for validation and feedback.
7	Deployment & Knowledge Transfer	Approved changes are deployed into the production environment, and relevant documentation and knowledge transfer are provided to IndiGo teams.
8	Post-Deployment Support	Initial stabilization support is provided to ensure the implemented changes operate as expected.
9	Closure & Documentation	The change request is formally closed after confirmation from IndiGo, and documentation is updated accordingly.

15. Commercial

Separate commercial proposal will be submitted .

15.1. Implementation

Lagozon proposes a **fixed cost commercial model** for the implementation of the Identity Resolution and Customer 360 Platform, based on the scope of work defined in **Section 4** of this proposal.

The fixed cost covers end-to-end delivery of the solution across all phases of the project lifecycle, including design, development, testing, deployment, and stabilization.

The scope of activities covered under the fixed cost includes:

- **Project Management & Governance** – Overall project planning, tracking, stakeholder coordination, risk management, and reporting.
- **Business Analysis & Requirement Management** – Requirement gathering, BRD/SRS preparation, use case definition, and stakeholder alignment.
- **Solution Architecture & Design** – High-level and low-level design (HLD/LLD), data architecture, integration design, and security design.
- **Development & System Integration Testing (SIT)** – Development of identity resolution engine, data pipelines, APIs, Customer 360 components, and execution of integration testing.
- **Data Standardization & Identity Matching Configuration** – Implementation of deterministic and probabilistic matching logic, scoring models, and data normalization processes.
- **UAT Support & Defect Resolution** – Support during User Acceptance Testing, issue resolution, and fine-tuning of matching logic based on feedback.
- **Production Deployment & Go-Live Activities** – Production environment setup support, deployment execution, go-live validation, and release management.
- **Documentation & Knowledge Transfer** – Preparation of technical, operational, and user documentation along with knowledge transfer sessions for IndiGo teams.
- **Hypercare / Stabilization Support** – Post go-live support to ensure system stability, performance monitoring, and issue resolution during the stabilization period.

15.2. Support

Lagozon proposes an **Annual Support and Maintenance Services model** to ensure the continued stability, performance, and enhancement of the Identity Resolution and Customer 360 Platform post implementation.

- **Incident Management (L2 Support)** – Resolution of incidents escalated by IndiGo’s L1 support team, including troubleshooting application issues, data discrepancies, and integration failures.
- **Application Support (L2)** – Support for identity resolution workflows, Customer 360 profiles, APIs, and integration processes to ensure smooth operations.
- **Defect Fixes & Root Cause Analysis (L3 Support)** – Investigation and resolution of complex technical issues, including code-level fixes, performance bottlenecks, and system defects, along with detailed root cause analysis (RCA).
- **Performance Monitoring & Optimization** – Analysis and optimization of system performance, identity matching efficiency, and API response times based on observed issues and trends.
- **Enhancements & Minor Changes** – Implementation of minor enhancements, configuration updates, and tuning of matching rules or thresholds as part of continuous improvement.
- **Data Pipeline & Integration Support** – Maintenance and issue resolution for data ingestion pipelines, batch jobs, and real-time integrations.
- **Security & Patch Management** – Application-level security updates, vulnerability fixes, and compliance with enterprise security requirements.
- **Release & Deployment Support** – Support for controlled deployments, patches, and periodic releases in coordination with IndiGo teams.
- **Documentation Updates** – Updates to technical and operational documentation based on enhancements and fixes.

Appendix

Few Customers Testimonials

At Lagozon, we believe the true measure of our success is reflected through the outcomes achieved for our clients. Our experience spans enterprise data engineering, identity data consolidation, and large-scale system integration initiatives across industries. The following testimonials reflect our commitment to delivering reliable, scalable, and business-aligned data solutions for our clients.

If you are considering partnering with us and would like to learn more about our client experiences, we are more than happy to facilitate a formal connection with our customers. This opportunity allows you to gain firsthand insights into the transformative impacts our services can have on your business processes and decision-making capabilities. To arrange a discussion or receive more detailed client testimonials, please contact us at [shubham.bhatnagar@lagozon.com]. We look forward to helping you achieve your **data and digital transformation objectives** with the same commitment and excellence that we have delivered to all our clients.

Rajiv Sikka

Group CIO, Medanta Hospital,
Gurugram

Medanta values Lagozon's year-long dedication & expertise in BI analytics, fostering collaboration & exceeding expectations.

Puesh Ajmani

President & Global CDO,
Welspun World

Lagozon, our year-long data analytics partner with Power BI expertise, enhances our decision-making processes.

Lakshman Sharma

CIO, Sarvodaya Hospital,
Faridabad

Lagozon excels in Healthcare vertical, enhancing our data visualization capabilities. Highly recommended for BI capabilities.

MN Chaturvedi

Director IT, Al Shirawi Group,
Dubai, UAE.

Over the past three years, our partnership has flourished, fostering strengthened bonds, trust, and mutual achievements.

Dr. Kamal Karnatak

Group CIO, RJ Corp

Lagozon team demonstrated strong problem-solving skills that had a significant impact on Power BI Application performance.

Prashant Lohar

Senior Manager (IT), Ajanta
Pharma, Mumbai

Lagozon's focused, skilled data team excels with a proactive, innovative attitude. Valuable collaboration!

Priya Dar

CIO, Valvoline Cummins Pvt.
Ltd.

Teaming up with Lagozon for Data Analytics, their proactive approach ensures successful collaboration.

NK Shrivastava

CEO, RefineM, North Carolina, US

Lagozon's Data Analytics collaboration showcased expertise, professionalism, earning a strong recommendation.

STANDARD TERMS & CONDITIONS

1. Applicable taxes are additional and will be applied as per the latest government policy.
2. **Proposal Agreement to be signed by both parties which can be served as Purchase Order.**
3. If PO raised, then PO to be released in favor of:
 - Lagozon Technologies Pvt. Ltd.
 - PANs: AACCL3013D
 - GSTIN: 06AACCL3013D1Z8
 - Contact Person: **Yash Nagpal**
 - Address of branch office: 1F/2A, N.I.T. FARIDABAD, HARYANA 121001
 - Email: yash@lagozon.com
4. Payment Term is NET60 (60 Days).
5. Consultants will work on the working days excluding weekends (Saturday and Sunday).
6. Consultants will follow customer's public holiday calendar.
7. At any customer, the site location outside Delhi NCR - Travel, Food and Accommodation - is to be provided by the customer during the tenure of the consultants.
8. Any products or services not mentioned in this proposal are deemed out-of-scope and such products or services will not be delivered by Lagozon Technologies.
9. The validity of the above prices is till **31st March 2026**.
10. **PO Address:** Any Order for availing our services pursuant to the said Proposal is to be placed on Lagozon Technologies and shall become binding on both Parties upon written acceptance by Lagozon Technologies. The terms and conditions of this offer shall override any conflict in the customer's order unless agreed to by Lagozon Technologies in writing.
11. **Warranty:** Except as expressly set forth in the said Proposal, Lagozon Technologies makes no other warranty to the customer, any person or entity or any kind, express or implied, including, without limitation, any conditions of quality and any implied warranty of title, non-infringement, merchantability or fitness for a particular purpose.
12. **Data Availability:** The Customer shall provide all necessary information, documents and data for the execution of the work. This information may include IT asset lists, Application Usage patterns, Office addresses & contact information, third party Vendor contact information. Non-availability of the information may lead to interruption of the work.
13. **Force Majeure:** Lagozon Technologies will not be responsible for interruptions and / or delays or stoppage of work due to acts of God, Government, Lockdown, statutory authority, violence, strikes, civil commotion, war, floods, or other causes of force majeure, which may affect the execution of the Project.
14. **Confidentiality:** Each Party will maintain the confidentiality of any information provided by the other Party under the said offer and during project execution.
15. **Utilization of Resources:** Services of Lagozon Technologies' employees deployed for the project may be utilized only for the tasks related to the work defined in this Proposal and / or the scope of work mutually agreed in writing, and not otherwise. Team will work for 5 days in a week, with weekends off.
16. **Limitation of Liability:** In no event shall Lagozon Technologies be liable to the Customer, whether in contract or tort or under any other legal or equitable theory (including strict liability) for any indirect, incidental, exemplary, punitive, special or consequential damages, including without limitation, personal injury or loss of business, profit, revenue, data, or programs, loss of work product or any and all other commercial damages or losses, even if the

Lagozon Technologies has been advised of the possibility of such damages. Notwithstanding anything to the contrary, mentioned elsewhere, Lagozon Technologies' total liability shall be limited to the value of money received in respect of services rendered under the order-giving rise to a claim by the customer.

17. **Work Rules:** Customer shall inform the rules, regulations, security policies & code of conduct to be observed by Lagozon Technologies personnel during the execution of the project at customer's site.
18. **Final Terms:** These terms and conditions form an integral part of the commercial or priced offer of Lagozon Technologies for the provision of Lagozon Technologies' services. These terms and conditions supersede all prior representations, warranties and agreements, written or oral unless otherwise agreed to in writing by Lagozon Technologies.
19. **Non-Payment:** In case of non-payment of invoices for a period of 15 days beyond the due date, Lagozon Technologies is free to exercise the right to temporarily halt the work being done by its consultants till the outstanding payments are received in full.
20. **Governing Laws:** The laws of India shall govern this Proposal and the resulting contract. The parties submit themselves to the exclusive jurisdiction of the courts at Faridabad, Haryana (India) in respect of a dispute arising out of or in any way connected with this Proposal and / or the resulting contract.
21. **Document confidentiality:** Customer should maintain confidentiality of the proposal submitted and should not disclose any or part of the information to other vendors under any circumstances.
22. **Deliverables:** As covered in the methodology section of the proposal
23. **Termination:** Either party can terminate this Agreement by providing a written notice of 30 days to the other party and clearing the dues bases on agreement.

COMPLETE AGREEMENT

This proposal constitutes the entire agreement of the Parties with respect to its subject matter and may not be modified in any way except by written agreement signed by the parties. In the event of any conflict, the terms and conditions of this proposal agreement shall control. There are no other agreements either express or implied with regard to this subject matter.

IN WITNESS WHEREOF, the parties hereto have agreed to proposal terms and conditions as on effective date of _____

Billing Type	Managed Services
Engagement Type	Project

IndiGo
